I also want to play games. But *the* games machine (the Amiga) is just a one trick dog, it can do graphics. To expand at all you need to buy and buy and buy again. The same goes for the IBM.

But there is no security on the road I am going to follow. I **want** the Falcon 030. So that is what I will get. And if anyone wants to start a software co operative to support it all they need do is email me.

>What about Mac and Amiga? Some may be wondering.. Mac is a great computer, but
>not as supported as IBM, simple as that.. Amiga, is like ATARI, very iffy, and
>I don't like it.
>

I would buy a mac over the IBM, and Amiga? well, haven't commodore just made it the heart of their CD^32 games console. Haven't they just admitted what people have been saying for years?

>I know alot of you only need a computer to do what you NEED to do, or maybe
>some may need it to do specific things.. For me, computers is a hobby. Yes, I
>need to do Word Processing, Telecommunications, Programming, and games.. Thats
>all I NEED to do, but I WANT to do much more.. I have not decided one way or

My needs are met by my current set up. My wants....I want a Falcon.

The Jaguar will be an awesome machine, But Atari is too cash poor to fund commercials.

Yeah, but suppose you want more than just a "decent" system? Suppose you want something with power equivalent to the Atari Falcon? You've got to buy a high-end MS-DOS box ('486 @ 66 MHz) to even come close. Surprise: you're talking $2500 to $3500. To do better, you're talking about a $5000.00 pentium.

Well when you post something as descriptive as 'big problems', then I don't think you can complain when someone fills in the holes and comments on what they think you might have meant (like flicker being as big a problem as they have seen).

If you are worried about True Colour modes, you can get a ScreenBlaster and I believe have up to 640x480 True Color (though it is close to that, the exact resolution may be incorrect).

You're thinking too small. The Jag might make a great *server* machine
for a bunch of Lynxen. I can envision a "Jaguar downloader" cartridge
for the Lynx, which would let it bootstrap down the ComLynx from the
Jaguar.

The complex calculations could be done by the Jaguar's processors, then
sent out on the ComLynx as sprite ID's/locations.
(I'm thinking Netrek/Jag-Lynx...)

Then the console/TV could be the "galactic map", while the tactical
screens would be the little Lynxen...

>I wonder how much market would be restricted for a game design which
>requires use of a lynx (or three)? Might it be that most Jaguar
>owners would also own lynxen?

Lots, and probably not _old_ owners, since there just aren't *that* many
of us out there. Imagine, say, $90 for the Lynx, ComLynx, and
bootstrap cartridge... and then you won't need to buy N extra cartridges
for every new game...

Yeah...

I have played Cybermorph. You can go anywhere on the playing area.
It is not "side-scrolling". You use the control pad to move
forward/backwards/right/left.

- mike

p.s. The 3D0 is 32 bits. That doesnt necessarily mean it is slower
than the Jaguar, but judging by the MIPs numbers you listed, I believe
the 3D0 will be significantly slower.

Well, if you read my post that was just previous to this one, you would
have seen that Atari says they will spend $3 million, 4th quarter 1993,
and $45 million in 1994 on marketing, with the possibility of going to
the public for additional financing in 1994 as well.

Granted, not $1 billion in cash reserves, but $45 million will buy a few
ads for them...

Don't get me wrong, the Falcon is a NICE machine, I've had one since June, but in most ways it is not nearly as fast as a 486DX66. If you want to do spread sheets, ray traces, and stuff like that then the 486 is probably the way to go.

I feel that the whole argument can best be summed up by saying this: If you want lots of easy to get software then get a 486. But if you like Atari and don't care about having the latest and greatest software every day, then you will most likely be more happy with a Falcon.

I have chosen to take the second path and I'm enjoying the Falcon a great deal. I don't believe that a machine can be 'dead' _OR_ 'thriving' in the short time that the Falcon has actually been available but there certainly seems to be enough things trickling out to keep me happy until the next machine that really catches my eye comes out.

I think a 486DX33 is comparable to a Falcon. The thing is, by the time I outfit one with a all the audio, MIDI, etc.. to do the same job, it would get expensive quickly. Although as a qualifier to that, I'd have to add that some (if not many!) of the components would be of higher quality.

I think the key to buying the right system is to have at least a general idea of the machine's intended purpose and pick from there. The Falcon (to my eyes and ears) seems impossible to top for MIDI and digital audio. Also might be fun to program, too. :)

3058. Announcing... NetHack-- 3.1.3!

Newsgroup: comp.sys.atari.st
Date: 1993-08-23 22:07:58 UTC
From: cherborth@semprini.tdkcs.waterloo.on.ca

Cross-posted to: rec.games.hack,comp.sys.atari.st,comp.os.os2.misc,comp.os.msdos.misc

Announcing...

NetHack-- 3.1.3!

Yes, finally, the wait is over!

After years of intensive debugging (ok, a couple of hours) I tracked down the vicious shopkeeper bug that was preventing me from releasing NetHack-- to the world.

Watch for the NetHack-- 3.1.3 patch (which requires the NetHack 3.1.3 source code), coming soon to rec.games.hack and alt.sources!

Atari ST/TT/Falcon030 binaries of NetHack-- 3.1.3 will be available on atari.archive.umich.edu (and its mirrors) in Games/nhmm31c.zoo real soon now. Don't download nhmm31c.zip, it's a copy of the buggy binary (with the nasty shopkeeper bug intact).

OS/2 binaries of NetHack-- 3.1.3 will be available on ftp-os2.cdrom.com in 2_x/games/nh31c--.zip real soon now.

DOS binaries of NetHack-- 3.1.3 will be available real soon now; I have to finish building it and figure out where to put it (I don't frequent DOS ftp sites). The DOS binary will require a '386 or better.

Please don't bug me for copies of the patch or the binaries; I'm a UUCP site and will not send anyone copies. Watch rec.games.hack for the patch, and check your favourite ftp sites for the binaries.

You cannot compare a 16 mhz 030 Falcon to a 486 box @ 66 mhz. IBM sells such a system in a tower case for under $2300(includes OS2).

In article <25b18mINN1bo5@rs1.rrz.Uni-Koeln.DE> kim@vax.mpiz-koeln.mpg.d400.de writes:
>Hi folks,

[Question about a GEM version of Gnuplot deleted.]

>Oh -- I'd like to ask the same question for GhostScript.

Mr Kim (and anyone else who might be interested),

Ghostscript 2.52 (atari.archive) can use windows, but not very well.
The port of 2.61, on which I am currently working, should be MultiTos
compatible -- i.e. a well-behaved full GEM application. Text is
redirected to a window, etc.

GS 2.52 looks at an environment variable named GS_WIN to decide whether
to use windows. If you set GS_WIN to "batch" and run GS with the
following options, everything should work as long as your postscript
code does not crash.

gs -q -dNOPAUSE yourfile.ps quit.ps

The -q and NOPAUSE options keep GS from sending anything to stdout. They
do not keep things written to stderr from messing up the screen however,
so it will only work nicely with clean postscript code.

Depending on what MTOS does with character output (I don't have it so I
don't know), you may be able to run GS (with GS_WIN set to batch) and
have MTOS direct stdout/stderr to a window. In that case, you wouldn't
need the -q and -dNOPAUSE options and everything should work fine.

Look in the ST-specific documentation for details of window usage, or
run GS from the gem shell (GemGS, also on atari.archive), which will do
all this for you automatically if you specify the use of windows in the
startup file.

From: greg@walrus.encore.com
Message-ID: <greg.746146837@walrus>
Source record: 202034

I have an Atari 1040ST (mono) and am interested in getting a bubble jet or laser printer and software for it. My wife is familiar with Word on both Macintosh and DOS, and would want something similar to that. I'd probably try to get LaTeX to work (after adding memory and hard-disk...)

Any suggestions for choice of printer and software?
Is there a port of Microsoft Word to the Atari ST?
Does it come with drivers for jet-printers?
I've seen a couple references to Atari Works?
Finally are there any places in Eastern Massachusetts area that carry such software, and/or where would I mail order it from, etc?

Many thanks,

Greg Schaffer // Encore Computer // 300 Nickerson Rd, Marlborough MA 01752

>you're talking $2500 to $3500. To do better, you're talking about a
>$5000.00 pentium.

You're dreaming. I've had a Falcon sitting on my desk beside a
386-40, and the Falcon is not even as fast as my 386. (except maybe
running OS/2's PM in 1024x768 at 256 colours) To get decent performance
out of the thing you have to cripple it by booting into a 2 or 4 colour
video mode. The scrolling at 640x480x256 is slower than Windoze at
800x600x256 on my machine. The printing output for Atari Works is not
even as good as the Write program that comes with Windoze on the same
printer. (Epson LQ850)
And the price comparison just doesn't work. A system like mine
sells right now here for $1500 with monitor. That's 8 meg, 200 meg HD,
non-interlaced monitor. A 4/80 Falcon is being advertised locally here
for $1499, regularly $1799.
Atari seems to have lost the Power without the Price war and has
nothing to replace it, unless you're a musician.
<Note, as this is liable to attact a lot of flames, I've set the
followup accordingly>

3065. MegaSTE4 + Misc Stuff for sale

Newsgroup: comp.sys.atari.st
Date: 1993-08-24 01:21:02 UTC
From: lchd_ss@uhura.cc.rochester.edu
Message-ID: <1993Aug24.012102.8382@galileo.cc.rochester.edu>
Source record: 202040

Haven't thought that I would need to upgrade up MegaSTE until
now when I moved to use MiNT. With a remote teminal hard wired and
ka9q running to let my friend remote login, this is now too slow
and small for me. So it's time for me to sell this and hopefully get
a TT or Falcon. However, this is a very nice system that is always
fast and big (RAM) enough for all the GEM programs under TOS for me.

The System:

Atari MegaSTE (16Mhz 68000) with 4 Meg of RAM,
50 MB internal hard disk
Tos 2.05
720k Internal Floopy drive
w/ 2 modem ports, 1 high speed serial/vme port/slot,
Midi in/out, ROM catridge port, LAN port,
external hard disk port, external floopy port,
parallel printer port, TV port, RCA audio left & right.

Hard Disk is now formatted for 4 TOS partition and 1 Spectre Mac partition.
Will reformat it and filled with PD/Shareware programs if wanted.

Atari SC1435 14" color monitor
Atari SC124 Monocrome monitor (bright and display size never adjusted)

Please send resoanble for the above as a whole.

Also, some softwares and misc stuffs:

Games:
SDI * $15
Balance of Power * $13
ST Karate * $10
Battletech * $15
Silent Service * $15
Championship Wrestling * $7
Roadwar 2000 * $13
Universe II * $15
Universe III * $15
Deep Space * $10
Falcon $15
MicroLeage Wrestling $7
Captain Blood $13
StarGlider $10
Leisure Suit Larry $10 (original disk gone, manual and backup disks only)
HardBall $7
Speed Ball $5 (original disk gone, manual and backup disks only)

Star Raiders $10
Air Ball * $10
Marble Madness (disks only) $5
Jewels of Darkness $10
Tanglewood $10

Other softwares:
Procopy $10
Timeworks Word Writter ST * $17
Art & Film Director * $20
STTalk $5
PC-Ditto (no manual, w/ original disk) $7
Music Studio $15
Mark William C $30

Software w/ * come w/ original boxes, disks and manuals.
Others have manuals and original disks unless specified.

VidiST Video Digitizer * $70
Computer Eye Video Digitizer $60
Epstart - Epson Printer Driver for the Mac in MagicSac (readable by Spectre GCR) format. * $20
ICD ADSCSIPlus hostadapter $75 (can't sell this before I sell the MegaSte)

All the price excluding shippin.
The first offer over $1100 get the whole thing (computer + softwares + misc stuff)

thanks

...
ling cherd
(716)271-5822 evening only, working during the day
lchd_ss@uhura.cc.rochester.edu

[A[A
External SyQuest SQ555 44 Meg removeable drive in a Mini PC Tower case including the ICD SCSIplus hostadapter. (1 catridge included)

Zoom 2400b fax modem (9600b for send/receive fax)

Computer Eye color video digitizer catridge

Vidi ST color video digitizer catridge

Star NX1020Rainbow Color 9-pin dot matrix printer. (1 color ribbon and 1 black ribbon)

Softwares:
Laser C, Prospero C, Mark William C, Art and Film Maker, Music Studio, PC Ditto software version, Word Writer ST, ST Talk, NeoDesk 3, ProCopy, Personal Pascal, etc plus many games.

Everything is in very good condition and looks like new (except the
catridges and some of the software manuals).

I am looking for $1600 for eveything. But please feel
free to offer for individual items. I am most interested in selling
the MegaSTE w/ monitor first however.

Thanks

I wouldn't worry too much about the 68000 in the Jaguar. I would imagine
it plays a very minor role in the machine. Many arcade games have very
low-powered processors (including *6502* and 68000) driving very powerful
hardware. The reason is pretty obvious: there is no general-purpose
CPU work to DO. Most games are Graphics + Sound + DinkyAlgorithm.
And if you take the Graphics + Sound load completely off the processor,
even a wimpy 13MHz 68000 can do a LOT of processing: ask any games
programmer where 60 to 80% of CPU processing is spent: graphics.

Yes..Dont buy an Atari STE with TOS 1.60.. There are a lot of errors in that
TOS Version.. F.ex,you cant bootup the computer in mediumres!
If you want an STE,buy one with TOS 1.62 instead.. Thats bugfixed..

(Jesper.Kock@kockens.ct.se)

Yes you still are, as I am 53 and a Limey as well..

I do enjoy all this rubish that I see here, but when things get up my Nose
I reply to correct the incorrect statements that I see here..

How come that the Amiga 1200 has sold some 500,000 in one year and every
one here claims that its a load of rubish, so who is telling the truth...

So come on you Atari Bigots get real, if you can.....??

We can stand upto the Yanks and there Nuk ships from coming here and I can
stand up to these false Falcon claims as well...

Roger.............. sheppard_r@kosmos.wcc.govt.nz

Well a Low Cost printer that comes to mind and is mentioned in Byte and some
Atari magazines is the EPSON Stylus 800..

This is faster than a Bubble Jet and cheaper to run and also a lot cheaper
and better than a HP DeskJet 500 from what I have read..

I don't know if there are any Atari driver for it though, has 7, ? built in
Fonts and two of these are scalable from 8 to 32 points..

This is a Piezo-electric printer, and you only replace the ink cartridge
when the ink runs out, a lot less than a HP Cartridge.......

May be there are some users here that can give us some feed back...???

Yup, it does exist. It did captivate me for awhile, for some reason. BTW,
if you leave it running for a couple of days without feeding or watering
the little person, his face gets green and he stomps around with an angry
look on his face :-).

I think I'll hold onto mine. However, I would think that you won't have
a problem finding a one for sale used. If all else fails, you might try
Video Place at (407)465-4745. I have not called the guy in ages, but
he ran an ST software mail order operation from his video store. If he is
still in operation, I would bet that he has it for sale (he had lots of
old games that I could not find anywhere else).

SL> as defined by WP?

JH> I've been wondering the same thing. The way I see it, the
JH> current PC market is getting very similar to the mainframe
JH> industry of the 1970s. Those 900 numbers for user support are
JH> another bad sign.

I have been getting E-Mail on my original post, from folks not wishing to bash the Atari world of STs and TTS and Falcons, but disputing my claim that Atari and Amiga are the only ones supporting the 'below the Low-End', as defined by WP.

The folks are claiming that there is PLENTY of stuff out there in the IBM world that is cheap, and does the job as well as anything (at comparible price) with Atari or Amiga.

Well, I still stay that IBM, Atari AND Amiga are straying away and going into the high end (from my point of view). Even the Atari is going 'high end' in the sense that the Falcon030 is really a 'niche' machine - and the Jaguar is aimed only at the home entertainmetn market (albeit in a BIG way!)

Who is looking out after the home user, though? I agree, when the '900-number' support lines start coming out, I worry. I want my computer to be user-friendly out-of-the-box. Point and click and all that. And I don't want it to be the pig that Windows is.

From: bonnie@netcom.com
Message-ID: <bonnieCC954J.E2z@netcom.com>
Source record: 202049

I have many documents over the years that I've had on my Atari. But I've bought a 486PC a few months ago. How do I get my Atari text files over to my PC? I thought the best way would be to make the Atari floppies readable by the PC. I put "EB3490" in my sector 1 of track 0 using Norton Disk Doctor to make my Atari disk readable to my PC. The disk became readable in terms of the directories, but type I'd say "type filename.txt", I'd get garbage characters or "Bad sector messages". Does anybody know how to do this? The FAQ answer for this group seems to be WRONG!

bonnie

It's not a requirement in a computer system, but it tends to be true of
video game systems. A system designed to use a TV for a display is pretty much
going to require a color crystal, and if they can use it to derive any other
required frequencies, they save by not needing more space for other crystals
or extra timing circuitry. That's why the 8-bit Ataris ran at 1.79 MHz in
the US and at 2.21 MHz in Europe (1/2 of the respective colorburst frequencies).
Also, as a bit of interesting trivia, the original IBM PC was clocked at
4.77 MHz because it was originally envisioned as a Personal Computer, i.e.,
something that would be used in the home, with a TV as a display. (4.77 is
1.5 times the 3.58.) Just like every other backwards-compatible decision IBM
has made, that idea has left it's mark in the ISA bus spec to this day...

>>the Falcon.
>

Yeah,Civilization is pretty much compatible with the Falcon.

The only problem is that all the colours are wrong!!!
This is not as major as it seems,it only takes an hour or so to become fully versed in the new colour scheme.

Also,it cannot be run from inside a folder,that is,all the files must be on the root directory of your hard drive partition.

Apart from thes minor quibbles,Civiization runs fine and is a classic game.
Anyone fancy trading hints/tips/achievements ?

Brian.

>which tends to be a bit of a problem with MultiTOS.

In principle this is possible with CoNnect under MultiTOS. As the
original gnuplot supports TEK 4014 and CoNnect can run external
programs in windows unter MTOS and even allows TEK output there
gnuplot could be run in CoNnects windows. The problem is, I didn't
get the author of the atariport to reimplemet TEK-Output in the
ATARI-version. Perhaps you have more luck?

Wolfgang

3085. Slideshow program

Newsgroup: comp.sys.atari.st
Date: 1993-08-24 11:01:54 UTC
From: cczdvh@unicorn.nott.ac.uk
Message-ID: <25csf2$2nf@unicorn.ccc.nottingham.ac.uk>
Source record: 202108

Does anyone know of a PD / Shareware program to create slideshows from either existing imported graphics or with an editor built in. Da's Vektor would probably do the trick but it's a bit expensive for my needs. A simple run time prog that will display a sequence from floppy disk is what I need though the ability to do dissolves, wipes etc would be nice.

Any suggestions much appreciated...

Sheesh. Here we go again. Format the floppy on the PC. End of problem.

In the unlikely (extremely) that this doesn't work, use any ST formatter that formats to PC standard. The other thing is to use the PC to delete the files afterwards rather than the ST as *sometimes* STs delete files in such a way as to upset the PC when the disk is reused.

I've never ever had a problem with 4 different STs (STM, STe, MSTe, Falcon) and probably 10 different PCs, when copying files.

>>True Colour works just fine on VGA.

>Gee and you know more than Atari does, you should tell them this...

>This is not what I have been reading many many times..??

Yep, correct. According to specs a Falcon cannot do hi-res TrueColor on a VGA monitor. But then I have seen some software (a picture slide show) demonstrated by people from Atari that did just that. They said it was actually impossible because of the monitor, but it still worked okay. I have seen this with my own eyes, but I am still in doubt wether I should believe it or not. Maybe it was an SC1224 with the TT vga monitor case around it (the sign said PTCxxxx or something. don't remember)

3092. MiNT slower than TOS

Newsgroup: comp.sys.atari.st
Date: 1993-08-24 14:01:25 UTC
From: thuerman@ibr.cs.tu-bs.de
Message-ID: <1993Aug24.140125.23103@ibr.cs.tu-bs.de>
Source record: 202117

A couple of weeks ago there was a discussion wether MiNT was or was not
slower than TOS.
I have installed MiNT 1.08 yesterday and played around with it for a while.
Some testing of its performance on GEMDOS filesystems showed MiNT indeed
to be significantly slower than TOS.
After a cd to /usr/users/thuerman I tested
du . (there were 2673 Kbytes in 588 files and 63 dirs)
cp -r . /d/tmp
rm -r /d/tmp/*
four times, with and without MiNT installed and using the built-in commands
of the mupfel shell and the GNU file utils 36.
Here are the results:

mupfel futils36
TOS MiNT TOS MiNT

du . 0:09 0:17 0:28 1:21
cp -r . /d/tmp 16:52 18:47 19:20 24:07
rm -r /d/tmp/* 1:35 2:40 1:56 3:54

What is the reason for this difference? Does MiNT have its own routines for
dealing with GEMDOS partitions or does it use the TOS in ROM (I have
TOS1.04)? Also, why are the GNU utils so slow compared to mupfel?

With the GNU cp under MiNT I got some error messages which didn't occur when
running TOS:
cp: /d/tmp/./bin: file not found
cp: /d/tmp/./lib: file not found
cp: /d/tmp/./src/chess: file not found
...

Despite these error messages the directories named were created and the
copying worked well. Anyway, how can I get rid of these annoying messages?

} TOS1.04)? Also, why are the GNU utils so slow compared to mupfel?

I don't think there's any disagreement that MiNT slows the computer down, the argument was about filesystems as I recall. The statement was that the minixfs filesystem is faster than the tosfs filesystem. In some respects, minixfs ought to be intrinsically faster - for example, moving files is simply an inode change, in other ways, it just seems to be much faster of itself. If you were to install minixfs on a partition, then re-run the tests and compare the tosfs results with the minixfs results, I think you'd find (well, *I* do) that the minixfs filesystem under MiNT is actually faster than the GEMdos filesystem under TOS 1.4 - especially for things like du, rm, and mv on large numbers of files.

As for why futils are slow, that's because of the way they're written (unless thi shas changed since I last looked). They were written to take advantage of un*x systems filesystem buffering, so that they read and write a byte at a time, and leave it up to the os to buffer that into large enough chunks to be efficient. Neither MiNT nor TOS do this efficiently yet.

} With the GNU cp under MiNT I got some error messages which didn't occur when
} running TOS:
} cp: /d/tmp/./bin: file not found
} cp: /d/tmp/./lib: file not found

well, you can (in sh) cp -r . /d/tmp > /dev/null 2>&1 :-))
(tcsh) cp -r . /d/tmp >& /dev/null :-))

STalker 3.2? You mean STalker 3.02, don't you? Otherwise I've been really out of the loop!

Both Gribnif and Eric Rosenquist, brilliant author, are accessible from the net and Rosy, at least, monitors this newsgroup. He tried to help me with a few annoying bugs in my STalker/STeno setup, although he quit answering my letters after a while. There is a need for an update--STalker should support Kermit protocols, prefereably in the their latest incarnations, there seems to be some sort of bug with TAB characters in some Unix systems, and programs such as AUXINIT should be embedded in STalker. Just today I stumbled over an annoying bug in probably the Unix's Z-Modem protocol that makes the Unix delete the ST file since the size/checksums don't match--I have to see if it does this with files besides ASCII.

I honestly don't think there's a better telecommunications program--and I've played on multiple systems. A "Fetch" like interface would be nice (swiped from the Mac). The ability to "grab and shoot" off the screen is absolutely priceless. I wish I knew a good BackTalk script programmer from whom I could buy some scripts! Every time I try it, the roof falls in.

Sure I can! At CeBIT last month, Digital Equipment Corporation was
proudly displaying their new Alpha-based computer. For comparison
purposes, they were displaying a 256-color Mandelbrot benchmark
(considered to be a good overall indicator of system performance).
The results:

Apple MacIntosh Quadra 12 Seconds
MS-DOS '486 @ 66 MHz 6 Seconds
DEC Alpha @ 150 MHz 5 Seconds

Sixty feet away, Atari was performing the same benchmark in

>>> 4 Seconds <<<

Sure, I can compare an Atari Falcon to a '486 @ 66 MHz!

^^^ Likely,
but not necessarily, I have probably $1000 invested in music software, but
not very much in the hardware.

>a substantial amount of money already invested in ST hardware. Is it likely
>that this person is now going to shell out bucks to invest in a complete PC
>system, and then also purchase a GEMulator, just to be able to run a fraction
>of the ST software on it?

The GEMulator's targeted customer is not intended for those with a large
investment in the ST, I don't know anyone that would buy a PC just to emulate
the ATARI. I believe that it is mainly targeted at the many Atari enthusiasts
that have some investment in Atari software, but for one of a million different
reasons, also own a PC (perhaps they like support). If you already own a PC (as
in my case) the GEMulator is much cheaper than upgrading the hardware on my the
Atari, and despite your argument to the contrary, it IS cheaper to buy add-ons
for the PC than the ATARI (and you can probably find a local dealer to purchase from)

>For most ST users, the cost to be able to use GEMulator has a floor of $500 to
>$1000, to obtain a usable 386-based PC system. Who knows what kind of video
>and disk controller cards you'll get in such a machine, what kind of memory

Even a generic VGA video card (which can be bought for $25-30 still has
better resolutions than an ST

>size, etc... On the other hand, the raw components are the same, and cost the
^^^ Granted the RAW compnents cost the
same, but there is a big difference in the final costs, like where are you
going to put the drive. Chances are you will need an external case and an
extra power supply

>same. Why buy a PC with 8MB of RAM, when you could simply put 8MB into your ST?
^^^ Right! try it
on a 1040ST and tell me how cheaply (or easily) it is done. (And you'll still
probably be limited to 4MB)

>(In particular, why buy a PC with 8MB of RAM when most applications still only
>use 640K; the extended RAM can only be used as virtual disk, file cache, and
^^^ NOT true, in the past maybe, but today almost all major software
(ie software requiring more than 640k) uses either expanded, extended, or
DPMI memory

What you're talking about here is output to the screen and there are known deficiencies with Atari's VDI code. A utility like NVDI (and hopefully Warp 9 soon) will make a big difference in the appearance of low performance. When talking raw processing power, the 16 MHz Falcon stacks up nicely with at least a 33 Mhz clone. Add to this the abilities of the DSP (standard on the Falcon so anyone can design code to use it) and in many applications the Falcon will keep up with even a 486DX50. In fact, a friend with such 50 Mhz machine was impressed with the Falcon and when showed the ability to record high quality audio to disk and perform effects (echo, reverb, etc) in real time, commented that he didn't think his 486 with DSP eqquiped sound board could even to that. We also found that the Fractal demo that uses the DSP takes 4.26 seconds to generate the mandlebrot set on the Falcon and 3.5 to 4 seconds on the 50 Mhz 486.

I agree that many things will do better on a 50 Mhz Intel than a 16 Mhz 68030, but if programs make use of available resources (like the DSP), then the Falcon becomes much more comparable to the mid to upper range clones.

If you have trouble with land pirates raiding your cities, identify
the exact square they are generating from and place a military unit on that
square. Presto! They cannot generate from there any longer! Once you attain
the ability to fortify a sector you can neutralize the sea faring pirates
also by finding out where they land and preparing a landing field for them
surrounded by military units inside fortifications. They do help out the
treasury by capturing the leader without fail.

This is going to be intense! I love this lynx up feature! That
way you can have some intense multiplayer 3-D games... SCREW SEGA Virtua!
This is going to be THE system... I gutta have it. I've been waiting for
a system that can be networked like that for multiplayer games... that's where
the money is in the future. I think I'd opt for one of these over 3DO since
3DO (at least the first generation machines) don't seem to have the networking
ability (as stated in Wired 1.2).

No, I am not sure. I assumed it was two chips. I will note that it
is apparently one chip. That would make perfect sense, as there are
ROMS large enough to hold TOS (easily). How many pins are there on your
ROM?

I assumed that since the TT and Mega-STE use 2 chip sets, that the
Falcon did as well.

NVDI's vq_scrninfo & offscreen bitmap stuff. vq_scrninfo is just the call
you always needed to roll your own device specific rasters in a portable
manner (which if you're doing hi/true color work is essential, since there
is no device independent TC raster).

If worst comes to worst, you can call Atari at 408-745-2000 and they can
direct you to the nearest dealer. I was suprised to find a dealer in my
area (Iowa) so I bet you will have good luck also. If need be, Atari will
authorize the nearest dealer to send you a Falcon mail order.

True Colour works with any colour monitor. On an RGB (Atari SC12xx, or similar) you can display 640*400 or a little more with overscan. The display is interlaced. On a VGA/SVGA you can display 320*240 or 320*480 withut interlace. This can be extended with ScreenBlaster or BlowUp030. If you have a multiscan monitor that can cope with RGB rates (about 15.75KHz) then all modes are at your disposal.

Rob S. Rice (rrice@netnews.upenn.edu) wrote:
: STalker 3.2? You mean STalker 3.02, don't you? Otherwise I've been
: really out of the loop!
Ya, I meant 3.02...

: STalker/STeno setup, although he quit answering my letters after
: a while. There is a need for an update--STalker should support
Maybe he's on vacation or something..

I think STalker is the best one I've used... It just needs more stuff...
Hopefully Eric will reply to me and I could give him some suggestions... If
not I may write to GribNifs CIS account and talk to them there...

Some things I think it should have are more transfer protocols built in..
like kermit. Zmodem Moby Turbo (supposed to be as fast as Ymodem-G but with
the reliability of Zmodem...) something to look at pictures while downloading.
like GIFLink on the PC... Since the TT and Falcon030 support 256 Colors..
maybe a script that checks for files ending in GIF, or TGA or PC1 etc... and
direct to the script...

The main thing I think it should have is to update the efficiency and have it
use the connect rate and not the DTE rate... I have my modem locked @ 38.4
and it compared the efficiency to that. just little things like that... I
have other suggestions but I have them writton somewhere...

Thanks for not respecting the followup line. I won't continue this
thread except in .advocacy, as that is what that group was created for.

Anyway, have you actually looked at the numbers posted for nvdi on
the Falcon? I used nvdi on my mega, and it was great, but the speed ups
for the Falcon resolutions don't even come close to standard ST
resolution speeds.
As for utilizing the dsp, I'll believe it when I actually see
applications ship other than music apps that use the dsp. That's
real applications, not graphic demos. There hasn't even been any TT only
applications shipped that I've heard about, though it wouldn't surprise
me to hear that there are some specialist applications sold in Germany,
and the TT has been out for several years.

|
| That is fascinating. Think of how two player sports simulations could
| be improved by including a "private screen" like an attached lynx for
| input of selected moves or plays. Or several lynxen with first person
| views, and a central screen with a "battle view".
|
| I wonder how much market would be restricted for a game design which
| requires use of a lynx (or three)? Might it be that most Jaguar
| owners would also own lynxen?
|

Here's an idea: Atari could bundle a Lynx with a Jaguar system and charge
a minimal extra, say $50.

With the Jaguar's DSP capability, perhaps we will be able to ComLynx over
phone lines. Hmm....

National ComLynx BBS
Dial in with your Atari Jaguar and play head-to-head against
players across the nation.
Atari Lynx also supported.
Download games onto your system with SoftSystem cartridge.
Nongaming activities include email, viewing online images,
online Atari catalog, electronic encyclopedia, ...

```
] >It is then 100% readable & Writable by the ST and the PC!
]
] If this is the best solution, this is the best solution, but I'd
] rather not take my atari out of the closet and do all the work of
] formating floppies and copying. My PC can partially read these atari
] disk, why can't it read it all? Why does the PC tell me there are
] sector errors. Why does the FAQ of this group say it works when it
] doesn't?

PC's use a 80-track, 9-sector per track format, with a 3-sector (or is it
cluster?) FAT table. Whereas many ST-Formats will use a 5-sector/cluster
FAT, which stuffs up the PC as it can't see the directory tables where
it thinks they should be.

Also, some PC's can't handle Twister/Skewed/Fast formats, and can only
read sectors in the 1,2,3,4,5,6,7,8,9 pattern as opposed to the random(ish)
positioning of Skewed sector formats (e.g. 9,5,2,8,1,7,3,6,4).

They are also incapable of reading 10 or 11 sector per track formats
Many are incapable of reading any further than 80 tracks

As the standard format for my disks is 10-sectors per track, 82-tracks,
before I transfer anything, I have to format a disk on the PC, copy
the desired files across to the new disk, and use that!

If the PC won't read the disk, then the only method you are going to do
it with is to format the disk on the PC, and then copy the files from
the ST (or, link 'em with a null-modem cable and transfer it across
at 19.2k)

Could the FAQ maintainer correct this information if it is in fact in-
correct!?! ^(Please!? 8-)

Hello,

I've been away from the purchasing of Atari related products for
awhile. The place I normally get software from hardly caries anything
now (and their prices are not competitive anymore). I know
this question has probably been asked before, but ...

What are some good place to order hardware/software from that
have reasonable/low prices?

My main concern is on prices for hard drives and hard drive related
utilites, like Diamond Edge.

Any help is appreciated. E-mail replies peferred.

If this is the best solution, this is the best solution, but I'd rather not take my atari out of the closet and do all the work of formating floppies and copying. My PC can partially read these atari disk, why can't it read it all? Why does the PC tell me there are sector errors. Why does the FAQ of this group say it works when it doesn't?

That's a little bit unfair of a comparison, considering that the
Falcon was probably using the DSP to do the fractal calculations,
hence the speedy results. Only a little bit unfair though, as it
shows something of what a program desiged to make use of the DSP could
gain...

Still, I would have to say that for raw calculating power, a Falcon is
not quite up there with a 486/66!! Not that I'd ever stoop to buying one.

>group seems to be WRONG!

If all else fails, format a blank disc on your PC (720K), copy all the
files from the old disc to the new one _on the Atari_, i.e. do disc
swapping if you have only 1 drive on it, then insert the new
disc into the PC, and you should be able to load up all the files.

For this very reason, i've formatted all my discs in PC style.

3129. Before Dawn

Newsgroup: comp.sys.atari.st
Date: 1993-08-25 00:02:28 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <CCAG44.F0A@sdf.lonestar.org>
Source record: 202077
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

What is the current version of Before Dawn, and are any English docs available? Can Before Dawn use real MODULES, or just new image files? If so, what modules are available, and how are they installed? Also, can the Warp5 star-module use animation? It would be nice to use the ringing clock or other animated image file with the star module. Is this possible? If so, where is the screen for setting the animation parameters?

Has anyone gotten TOSWIN and Before Dawn both loaded as desk accs? If so, how?

Any assistance would be greatly appreciated!
Please Email me as :
evanlang@sdf.lonestar.org

Thanks,
Evan Langlois

I'll say this. I'm a lynx owner...and was thinking about selling my
Lynx. Now, I don't think I will. I'm contemplating starting to
set back money to buy a Jaguar instead....

I'm sure that Lynxes could sell a few of the intial Jags, and then the
Jags could then start selling more Lynxes (and the cycle continues).

It helps that you can advertise BOTH at the same time. And the link
between Jag-Lynx is alot stronger than SNES-Game Boy (like, there actually
migt BE a link!)

##

... Hallo !

Ich habe Probleme mit meinem 1040 STE (Bj 89) , da dieser eine angeschlossene
Festplatte (Megafile 30) zwar lesen kann , aber nicht beschreiben bzw.
formatieren , d.h. beim Schreiben werden die Daten der jeweiligen
Partition zerstoert und Formatieren tut er nicht .

Ich nehme an das dies mit dem DMA - Baustein oder einem
Interface - Treiberbaustein zu tun hat .

Hat da jemand schon mal aehnliche Probleme gehabt oder kann mir
irgendwie weiterhelfen ?

Fuer jeden Hinweis dankbar ...

It does work for disks that were formatted using TOS 1.4 or greater, or were formatted by a third party formatter that writes the correct PC bootblock.

Now, you might want to try using DC Formatter to write PC bootblocks on your ST disks. Given that the ST disks are of normal ST format (TOS 1.0 or 1.2), that is all that should be needed. Perhaps what you are doing with Norton is a not complete solution.

You can get DC Formatter from atari.archive.umich.edu. Good luck.

Perhaps because of the existence of rec.music.makers.synth? That's where I post all my ST MIDI questions, as do most netted ST MIDI folks.

I don't share the original poster's zeal, but he's got a point. An ST emulator that doesn't do MIDI is kind of like a Mac emulator that doesn't do DTP.

> I think that if you have a Falcon for a few days you'll never want to give
> it back.

I think a lot of Atari users in this country have thought we needed a good distributor in NZ for quite a while. At the moment the last I heard on the situation is that officially we are being taken care of by Atari Australia, (of which I have heard mostly very negative comments) and that they will not be releasing the Falcon in NZ in the forseeable future. Reading between the lines, they will not release it unless it is a run away success in their own market If it was of course we probably wouldn't see many anyway as they would fill their own demand first). The net result is that Atari in NZ is looking very sad as any sort of proposition. Amiga 1200's are selling modestly but even they (with Commodore's pretty good distribution system) are having pretty stiff competition from the PC Clone market. Here in Christchurch I could pick up a 486DX-33MHz with 2Mb RAM, 170Mb IDE or SCSII II Hard-Disk, VESA Local Bus slots, 1Mb Local bus Windows Accelerator, Digitally Controlled 1024x768 Noninterlaced Colour Monitor, Bundled with MS-DOS 6 and Windows 3.1 for $2749NZ (+ 12.5% GST/VAT). If you want to do some rough currency calculations for UK Punds divide by 3, for US Dollars divide by 2.

If I had the money I'd probably buy something along these lines and run Linux anyway.

Cheers,

The Falcon is about 3 times faster than an ST. With NVDI on both machines the Falcon is almost 5 times faster. All this in monochrome. As an approximate guide - The Falcon runs at 640*480*16 colours at a comparable speed to an ST running in monochrome.

Folks, I edited my first reply and the above is what it should have looked
like. Why it didn't get to the net that way, I don't know.

Now that several copies of the special issue of Atari Explorer Online has
been posted, you can read this for yourself anyway.

Sorry for the first post that went awry. This one was just to prove that
I can really use an editor. <grin>

On another note, I have send email to Travis Guy (AEO editor) asking for a
way to get the orginal true color targa files. I was very disappointed
in the quality of the attached 320x200 256color gif files.

I'll "third" that motion. :) The ST was and is a MIDI machine. If GEMulator can't do MIDI, then it is ignoring a sector of the market that both spends a lot of money on Atari hardware and software, but also is probably eager to purchase something like the GEMulator.

(Hopefully Darek will remember that Atari has always advertised the ST, and now the Falcon, in the music industry first and foremost... we have more Falcon dealers who are music stores than computer stores where I live...)

hello,

does anyone know of any digital to analog hardware for the ST?
i'm interested in driving three mirrors that would reflect a laser
beam. so, the hardware would have to have three or four channels.
i have a 1040STf, which would probably mean using the cartridge port.
(i hope the cartridge port is writable--i remember reading something about
not being able to do it easily..)

any info would be appreciated...

It's time you did just that. Here you rave about Atari just selling "this" many units and the A1200 is doing so great. Well you amiga guys don't seem to read your own mags. In an issue of Amiga format or something there was a report of Commodore finances. It stated that they have lost just a sum of $ 279 million dollars the last 9 months. That is almost half their sales. You were shouting high as hell when IBM reported its loss, but still that was not half their sales. And another thing how can the A1200 have sold as many as 500 000 units world wide and not have a better effect on CBM's figures. Either that number complete lies or CBM don't make any money on selling the A1200 the production cost may be to high, compared to the sales price?! I think both is the right answer. CBM has started to get a habit of makin "no profit machines" the last couple of years. Their PC's for example, it sold a lot, but it didn't earn them money. I won't even bother to mention the Amiga CDTV, oops, shouldn't do this, but I have ask a question... Did they sell 500 000 units of Amiga CDTV too What good is it to make machines when you don't make money on them. And what is the new Amiga CD compared to the Jaguar... I think a LADA.

...and talking of support... I am working for a dealer in Norway that sells both amiga and atari and I asked for some info about the Amiga CD about a month ago just before it was revealed. Then they said they would send out some info about it and the Norwegian price and marketing plans, as soon as it was revealed in London. That was fair enough, but the Amiga CD was revealed a long time ago now amd still no sign of the info. This so called good commodore support is even worse than the support we got from the old Atari Norway office. The support we get from the new offical Atari office here in Norway is A LOT better than the support we get from Commodore Norway.

'Scuse me George... come back down to the real world...

A'486 system can be had for a LOT less than a Falcon, and with a lot
more USABLE features.

Not to mention that an equivalent '486 system can actually be FOUND at
a zillion times more dealers, and software is actually *available*...

Do YOU do "direct to disk" recording..? If you do, you're in a tiny, tiny
minority of computer users... why not pay for a bigger hard drive, or
a better resolution monitor instead of features you'll never use..?

>I know they're pictures and they seem to be smaller, a lot smaller than
>gifs, but are they as good in quality?

The difference between Jpeg compression method and other methods (like GIF) is that Jpeg is a compression with loss, while others are compression without loss... When you store an image in GIF format, you will retrieve it intact, pixel by pixel. When you compress a file with Jpeg, you can choose a compression rate. When it increases, the size of the file decreases, and the loss icreases => the quality decreases too...
It's a compromise: there's a limit under which you can compress most files with no noticeable loss, and suddenly, passing this limit, the loss will be inacceptable... This limit depends closely on the image style... (contrast, mainly line-based composition, or value-based composition will change the point where you'll decide that there is too loss)

It's true that for most images, compression with no noticeable loss will produce files much smaller than GIF with of course no loss at all...

There's no server called "quepase" here. What you mean is "quepasa", but
you don't need that, either. Simply try ftp.cs.tu-berlin.de and you'll be
connected to the current ftp server.

|> sector errors. Why does the FAQ of this group say it works when it
|> doesn't?

Different versions of TOS and also different ST formatters write different kinds of boot sectors. STs are flexible and will read pretty much anything thats close to what it is expecting. PCs are very fussy. If your on a TOS1.4/2.06 or any other TOS that write PC happy boot blocks then you will be able to read these disks on a PC. TOS1.0,1.2 and probably a few others write boot blocks that PCs don't like. There are many ST formatters that were designed to specifically write this PC type boot sector.

If you want these files on your PC that badly, you will really need to start up your ST and do a little work. Why not use comms packages and a null modem cable? Otherwise a RAMdisk will greatly speed up the copying process.

>instructions per cycle, 96 MIPS. This DSP is only running at 26.6 MIPS,
>although it can operate on more data at once (nearly 3 times larger word size).
>Dunno...

Just a small point here. The 56001 DSP in the Falcon can achieve a base rate,
at 32 MHz, of _16_ MIPS. Most instructions on the DSP take 2 clock cycles. Many
of these instructions can be combined with a parallel move of data, and this
combined with the pipeline yields the theoretical peak figure. This peak
figure is largely unattainable, and for most purposes it can be assumed that
you will only get 16 MIPS performance, and with clever coding and use of
parallel moves you could get 32 MIPS on some occasions. 96 MIPS is not very
likely in any practical piece of code 8-).

>>
>>There are two custom chips, code-named Tom and Jerry, which combined contain
>>four processors. Jerry has the DSP, the 8K SRAM, a sound block and a block for
>>"timers, UART, joysticks and clock control." Tom has the "DRAM memory

>>separate as it has the DRAM and cartridge/CD-ROM ties.
>
>So we *can* get to the 68000 itself. Good enough...

Does the Jag have built in collision detection? This is what really cripples
the SNES a lot of the time - its puny CPU can't handle the collision
information produced by its hundreds of sprites. Fortunately, even if there
isn't built in collision detection, a 13ish MHz 68000 is ample under most
circumstances to do it in software, so the Jag is probably reasonably well
catered for here.

>> Ladies and gentlemen of the net...Let the speculation begin.

What's this 'begin' business - as far as I can tell we've been speculating
for a long time!

-> How come that the Amiga 1200 has sold some 500,000 in one year
and
-> every one here claims that its a load of rubish, so who is telling
the
-> truth...
Big seller doesn't mean best machine. Just look at the sales of Game Boys vs Lynx or Game Gear, two technically superior machines but hype sold the former in huge quantities. I thought that the My machine is better than yours died out with the Spectrum and C64, obviously not. You should always remember, each to his own and use whatever best suits you. I use a Canon camera because I like it, somebody using a Praktica could probably take better pictures than me or pics of a different type, doesn't mean one is superior, it's the end result which counts.

I couldn't figure out who said what in the semi-original article....
[LOTS deleted for brevity/lack of relevence
>>>On CIX (the biggest UK
>>>BBS) there is general agreement that Connect is the best comms package
>>>around. There are even scripts being written for it by UK users and someone
>>>is already adding the UK call charges to the call cost calculator.

Is someone collecting the various Connect scripts together & putting
them on an FTP site the rest of us can get to ??

>>No one here uses Connect as its no good in Medium Res, that is a
>>Fact and can't

I haven't figured out where 'Here' is yet... New Zealand ?

I personally don't use connect because the 'demo'(shareware?) versions I keep
running across DON'T emulate the behavior I expect from a terminal
emulator - vt220 or vt320 emulation. Uniterm, on the other hand does
it EXACTLY the way I want it. If there were a script for Connect that
would set it up like a Uniterm 'vt200' style terminal I'd go for it.

In a couple more months we will be going to 9600+ baud modems on ALL
of our modem pools here and I'll have no choice but to upgrade my 2400
baud modem (Which can't deal with the high speed modems we purchase.)
and then I'll start using Connect just to get more than 19.2K baud.

Can anyone recommend a GOOD font that works with Connect ? The
possible choices for it now don't look very good on my mono monitor.

And how do I get it to do a 24x80 character screen ???

I have to concur with Bob here <imagine that!>. :)

For reference, I just bought a new EISA box the other day to act as my
internet gateway at home. For $3400 I got:

486-DX2/66
256K cache
16mb RAM
8 EISA slots
2 local bus slots
EISA scsi controller
500mb 10ms scsi disk
local bus 1024x1024 video card
15" non-interlaced monitor
new MS mouse
DOS 6.0 (which I promptly deleted and recycled the disks)
Windows 3.1 (ditto)
Msoft Excel 4.0 (which I brought to work and use on one of my pc's there)
installed linux (including X windows)

So according to the previous poster, this system is at par with a Falcon.
We all know my stance on Atari so I won't rehash that again, but I do
think it is comical to compare a machine based on a 16mhz 68030 (and no
FPU) with a system such as the one above. Of course, we all know that
a nice 486/66 system can be had for $1500-2000 these days, but I used
the previous poster's pricing (and my own machine as an example) to
show what a silly comparison it was.

As many people have stated, if you happen to be in that tiny group
of people who want/need MIDI or "direct to disk" recording, the falcon
may be your dream machine. In terms of "power without the price" though
it isn't even close to the pc clones or the new Macs.

Happy computing to you,

Chris

3166. Run GNU Emacs with Mupfel

Im having a hard time trying to make GNU Emacs 18.57 run with
the Gemini/Mupfel-shell.

Complaints are
shell MUPFEL is not powerfull enough to run GNU Emacs
it lacks the ability to position the cursor
(or some thing like it)

Questions are

1) What termcap-entry(s)1 should be used
2) Is there a pre-dumped version that I can use (and where)
3) How should the batch file for calling Emacs look ?

I dont think the problem i MUPFEL, since MicroEmacs works fine.

sincerely
(a new GNU user)

Hello all,

that's what I found today in comp.sys.sgi.announce

--------cut here---------

NINTENDO AND SILICON GRAPHICS JOIN FORCES TO CREATE WORLD'S MOST ADVANCED
VIDEO ENTERTAINMENT TECHNOLOGY

[This press release has been slightly edited to remove any blatant commerical
aspects. MJW:moderator] (my remark: :-)))))

SAN FRANCISCO, California (August 23, 1993)-Nintendo and Silicon Graphics, Inc.
(NYSE:SGI) today announced an agreement that will transform video entertainment
by developing a truly three-dimensional, 64-bit Nintendo machine for home use.
Nintendo's "Project Reality" is the first application of Reality Immersion
Technology, a new generation of video entertainment that enables players to
step inside real-time, three-dimensional worlds.

The worldwide Joint Development and License Agreement teams Nintendo's
industry-leading expertise in video game development with Silicon Graphics'
renowned visual computing technologies that enabled filmmakers to create the
unprecedented special effects for such movies as "Terminator 2" and "Jurassic
Park."

The product, which will be developed specifically for Nintendo, will be
unveiled in arcades in 1994, and will be available for home use by late 1995.
The target U.S. price for the home system is below $250.

The "Project Reality" effort will create Nintendo's next-generation system
featuring realistic graphics, high-fidelity audio and record-setting speed. At
the heart of the system will be a version of the MIPS(r) Multimedia Engine, a
chip-set consisting of a 64-bit MIPS RISC microprocessor, a graphics
co-processor chip and Application Specific Integrated Circuits (ASICs). For
the first time, leading-edge MIPS RISC microprocessor technology will be used
in the video entertainment industry creating new levels of speed, realism and
excitement. The graphics co-processor and ASICs provide the specialized audio,
video and graphics capabilities. The same MIPS RISC microprocessor family
today powers computers ranging from PCs to supercomputers.

The Joint Development and License Agreement represents a long-term, worldwide
business relationship between Nintendo and Silicon Graphics. Under the
agreement, Nintendo will pay Silicon Graphics royalties for use of the licensed
3D technology. This unique product will be available specifically from
Nintendo. Application software will be supplied by Nintendo and its current
and future authorized licensees.

Reality Immersion Technology

Reality Immersion Technology uses the world's most advanced graphics and computing capabilities to allow video game players to directly and intimately interact with virtual game environments. This new generation of entertainment creates infinitely evolving worlds that instantly and continuously react to the commands and whims of the individual players. With Reality Immersion Technology, video game players, for the first time ever, actually become part of the game itself.

Silicon Graphics' recently introduced Indy(tm) desktop computer provides an ideal authoring system for current Nintendo developers wanting to create applications for the "Project Reality" platform. Indy also supports the Indigo Magic(tm) user environment, the world's first Media User Interface (MUI), a media-rich, point-and-click interface that will enable developers to further enhance their home entertainment software.

----------cut again----------

Now, if this is out in 1994 in the arcades as they say, who will wait and buy a Jaguar of Atari, when there is a Nintendo/Silicon Graphics joint force ??
And the amount of advertising, Nintendo will provide, will be enourmous, I guess.
What do you think?

What do you mean, "wait and buy a Jaguar"? Jaguar will be available a full two years before Nintendo's expected release of a home system. Who would wait to buy (possibly) equivalent technology two years later?

>And the amount of advertising, Nintendo will provide, will be enourmous,
>I guess.

>it EXACTLY the way I want it. If there were a script for Connect that
>would set it up like a Uniterm 'vt200' style terminal I'd go for it.

Have a look on CoNnect Version 2.20. There even the last problems with
our VAX emulating vt220 disappeared. If you still find problems, just
make a capture of your session (full capture, NO ascii capture) and send
it uuencoded to me. I will then be able to find bugs.

Normally problems with vt220 are just set-up problems which could easily
be solved reading CoNnect's Online-Help.

>Can anyone recommend a GOOD font that works with Connect ? The
>possible choices for it now don't look very good on my mono monitor.

The fonts coming with CoNnect work quite well. They even allow
80x24 on ST-Mono. You also can install them without GDOS by putting
them in a folder named GEMSYS in the CONNECT folder.

Ok, I don't mean to flame anyone here, but there seems to be a misconception here that for ST and Amiga owners, a 486 is price-competitive when you talk about a $1000-$2000 machine. Towards the higher end of that spectrum, I think that is true, but I recently went shopping with a friend for a PC.

The specs he wanted were:

Vesa LocalBus slots
EISA (optional)
340MB SCSI drive (not IDE)
accelerated SVGA

He did not want a 486SX. He wanted a 486DX. When we gave the salesman our "fantasy" list of hardware, he told us that our $2200 66mhz computer had become a $5000 machine.

:)

So we did various other configurations, and believe me, the base price on a PC with a decent processor (486/33) and HD (200MB) with SVGA and 4 or more MB of RAM is *very* competitive... I've seen those as low as $1300. But when you add a good sound card ($200-$500), SCSI support ($50-$250... actually, one we priced for EISA was $600 :)), it starts to add up. Certain things in the Atari and Amiga (like, oh, sound :)) which we take for granted are usually not standard on a business machine package.

I think a very nice Falcon system could be done like so:

Falcon 030 w/ 1MB, no HD: $800
RAM board: $100
8MB of RAM: $300
Mitsbuishi SVGA monitor: $430
340MB SCSI drive: $400 (i've seen Maxtor 340 IDEs for $320)
assorted cables, etc.: 70
======
$2100

For some people, continuing to use an SC1224 monitor would mean saving the cost of the SVGA (while losing the features of it), making the price of this setup pretty tolerable.... though I won't go so far as to say

it is better than the PC clone prices... <that would be ludicrous :) >
But it is in the ballpark of a decently equipped 486/33 PC with sound, SCSI,
etc....

(Friend of mine just bought a 486DX2/66 with barebones setup mail order...
$2100 with no monitor, a non-accelerated SVGA board, but with a SCSI-2
board and a 212MB HD...)

Well, yeah, I'll agree, but I think your example could have been better. :)
A $3400 system isn't exactly "power without the price". :)

For $3400 you could get a serious Atari machine. Why someone would spend
$3400 on an Atari machine, I don'tknow, but it could be done. :)

I think in the sub-$2000 category, though, PCs look good, but need some
extras to be fully appreciated. :)

>about it. Does anybody know why?

Oh this is a heck of a story.

Back in 1990 I did a WAACE show as a vendor (yep, 'lil ole me was once
a developer :)) and it was a nice homebrew kind of show in a high school,
and it had high attendance, and a decent number of vendors, including local
stores as well as a few visiting mailorder stores.

The thing that I think has killed the show is, officially, that Atari won't
directly support the show with a visible presence. Last year, I heard this
is what happened... I did not attend. I did read a lot of the discussions,
and the gist of it seems to be that the Glendale show and the WAACE show are
so close together that Atari didn't feel they could do both.

However there have been some other problems.. there was a movement, led
by John Barnes (Junkyard Pussycat) a while ago to move the show into the
site used most recently, the expensive Hyatt Regency in Reston,VA. Vendor
tables doubled in cost, hotel rooms went up, and worst of all, they began
to charge $6 or so per person per day to attend a usergroup show for a
platform whose popularity was shrinking.

In 1991, the number of vendors decreased from the previous year, but to
be fair, it was from a combination of both a sagging marketplace and
the change in the location and cost.

Also, I think the hotel *is* a nicer place, but... I think the Atari market
is by its nature not going to support expensive "professional" shows in the
USA. It lost the hobbyist atmosphere and I think that is where it went
wrong...

$5000?!?!?!? You can get a Zeos 486/66DX with:

Localbus
EISA
16Mb RAM
527Mb SCSI drive
SVGA w/1Mb RAM
SCSI on motherboard
(only important stuff listed)

for $2995.

Add $150-$200 for a 16-bit sound card, and you're off to the races.

Sorry, but there really is no comparison.

Tom

It sounds promising. Of course, Nintendo has a tendency to try to steal
the thunder from any competitor with vaporous announcements, such as their
"32-bit CD-ROM" when Sega announced theirs.

They were still talking about it when Sega sold their first 100,000 units. :)

Atari would have a little over a year's head start on them. Considering how
advanced Jaguar technology is, and the price point on it, I think they may
come out equal, with Nintendo probably benefitting more from having more
3rd party groups onboard for the ride.

I have the following for sale.

$90 Atari SM124 Monochrome Monitor

$90 Golden Image DS Floppy drive for Atari ST. 720K. Less than a year
old.

$80 Atari 520ST computer with TOS 1.0 and 512k.

Please reply to kolkmeie@cse.uta.edu or call 817-861-1366.

3183. Piracy BBS's in The Netherlands ..

Have some of the low bastards that send megaloads of cracked titles
along the globe by means of pigeons, snailmail, hollow teeth
or paternally adressed international central offices,
already infested the Netherlands ?

If so, I'll be more than happy to receive phonenumbers of the finest
among them! (At, of course, my mail-address.)

THIS IS NO FLAMEBAIT, and I can very well do without the old bunch
of pros and (mainly) cons w.r.t piracy. Just mail me some numbers,
or skip this article.

Thanks in advance!
RowdyB,
The Netherlands.

You might have an alignment problem on your floppy. My ST floppy
had to be adjusted some years back and now the problem has come
back. The partial read sounds like misalignment somewhere.

Hi!

I'm running Master Tracks Pro V3.mumble (last version before Passport axed support) on my 1040ST. I've been thinking about a Falcon since I would like to have a hard disk and more memory and adding those upgrades to my ST would cost me over half the price of a Falcon.

Anyway, I need to know if the software I have now will run on the Falcon. The biggie is Master Tracks Pro, of course, but I'm also curious about these others:

Dr. T's ESQapade patch editor (for Ensoniq ESQ-1)

Timeworks Desktop Publisher

Any comments from people who have *actually run* these programs on a Falcon would be appreciated. E-mail me unless you think the rest of the world would benefit form this knowledge <grin>.

>(or some thing like it)

Hi,

the MUPFEL *is* powerful enough to run emacs.
Set TERMCAP to "c:\etc\termcap" or where your termcap file is.
Set TERM to "vt52"

Use a termcap file that includes vt52. I use the Mupfel with
50 lines instead of 25, so I changed "li#25" to "li#50".

I can send you my termcap file.

Yours
Bjoern

First of all..alt-games-lynx is involved in this question?

GemView will look at img files but has you mentioned it is a big program.
There are other,smaller program which will view img's for you.
Check a.a.u.e.

Here's a question, are they any p.d. program which will allow you to edit
an img pic?

>DTP.

Hmmm... well, contrary to the popular opinion that seems to run ragged here, there really ARE Atari users who are not MIDI-or-die fanatics. :) Hey, wish I DID know more about it but let's face it, I just don't have the time to develop much more than even a passing interest in MIDI. My teenage sons, however, would probably like MIDI as they are into 'classical' music... you know, things from the Beatles, Rolling Stones, etc. :)

But to those who use Atari software for other applications, the Gemulator's support or lack thereof for MIDI is really a moot point. I mean, it would be fine if it DID support MIDI, but don't ask me to pay any more for a feature I would likely never use, OK?

Now on-board Mac emulation with 32-bit color is another story entirely! :)

Ralph is not a bad guy, hmmm, tell that to the 9 or so people in the UK who paid for new USR modems from him which they never got, and another person in another country who with some friends payed for some HD equipment from his company (ABCO), some of which they never got and some of which was damaged. That was only after _lots_ of phone calls and faxes, apparently he is/was being taken to court by a guy in the
US.

I'll have to say this is all 'allegedly' though, wouldn't want to get sued for libel etc. ;-) All true from what I have read from those concerned.

3198. Televideo 900 terminal emulator

Newsgroup: comp.sys.atari.st
Date: 1993-08-25 22:53:05 UTC
From: boyd@sonya.math.fsu.edu
Message-ID: <CCC7KH.GyM@mailer.cc.fsu.edu>
Source record: 201963

I am posting this for a gentleman that has no write access to news. Please respond via posts to this thread only.

Ok, this guy needs one of two things:

a) A modem program which can emulate a Televideo 900 series terminal.
b) A modem program that has a totally "dumb" terminal mode.

Here is his problem. He wishes to connect with a machine he has at work (I believe it is a "Prime", running some sort of real estate software). He is currently using Flash in vt-52 mode. The Prime is expecting a Televideo 900 series terminal, so all the control sequences are wrong (not surprisingly). His main problem is that he has to hit return to see each line of text being sent over.

The best solution for him would be to find a correct terminal emulator. The next best solution (that I could think of) would be to get a program that does not attempt to interpret control sequences at all. He states that he is willing to live with this.

Thus, does anyone know of a Televideo 9xx emulator for the ST? Alternately, does anyone know of a way to get a totally dumb terminal? For example, is there a way to hamstring Uniterm (or any other terminal program) so that it does not interpret control sequences at all?

Thanks in advance (from him) for any assistance.

> b) A modem program that has a totally "dumb" terminal mode.

Here is another datapoint. "grep televideo /etc/termcap" yields:

v8|vi|tvi925|925|televideo model 925:\
v1|tvi912|912|920|tvi920|old televideo:\
[...and a whole bunch more...]

Thus, a new question is formed. Is there any modem program out there that accepts UNIX style termcap terminal descriptions? It would seem that this would also solve the guy's problem.

Again, thanks in advance (from him).

Um, excuse me? You just bought a decked out box like this to be an internet gateway? Isn't that a little bit excessive? (Ok, side issue, but it points out another significant point - what is the minimum configuration you would consider *useful* on a given platform. Chris seems to think a 66 MHz 486 with 16 MB of RAM is required to make a serviceable packet switch. Doesn't that seem a little excessive to anyone else? I mean, I was using a 4 MB Mega ST for this purpose, long ago. Of course, I recall that an equivalently configured KA9Q for MSDOS weighed in around 600K, and only 120K on the ST, so I guess he really needs that 16MB of RAM... And of course, when all you care about is getting what you want to do done, you don't care how many bytes or dollars you wasted getting there.)

Btw, have you checked to see what your DOS-level (or Linux, since I see that listed down below) disk data transfer rate is? Or even the raw rate you can attain by banging the controller registers yourself... The raw rate is probably respectable, I'd guess around 1-2 MB/sec tops, with the DOS rate somewhere around 500KB to 900KB/sec... Speeds that even a 1985 520 ST will match. No comparison to the Falcon...

>So according to the previous poster, this system is at par with a Falcon.

>a nice 486/66 system can be had for $1500-2000 these days, but I used
>the previous poster's pricing (and my own machine as an example) to
>show what a silly comparison it was.

Hm, why the quibble over the FPU? That only costs $20, and pops right in.
(16 MHz parts are real cheap these days, y'know?) However, I'd agree that it's
silly to compare a 16MHz cpu to a 66MHz cpu; "all else being equal" will never
be true.

>As many people have stated, if you happen to be in that tiny group
>of people who want/need MIDI or "direct to disk" recording, the falcon
>may be your dream machine. In terms of "power without the price" though
>it isn't even close to the pc clones or the new Macs.

Well, speaking as a musician who couldn't be anywhere near as productive
without MIDI, since I picked up Cubase 3.0 (secondhand, $300), I'd have to
say that Atari is still the ultimate power, without the price. Nothing else
compares. When I get hold of Cubase Audio, geeze... I don't care about
direct-to-disk recording; that really has nothing to do with MIDI and I'm not
overly concerned with digital mastering just yet. But being able to have the
equivalent of a sampling sound generator with infinite patch space, at a
tiny incremental cost (software upgrade only), that defines power pretty well
for me.

And speaking as a hacker, well, the '030 is still a far better chip to code for
than any Intel creation, and the possibilities from the DSP are still too vast
to define.

>Happy computing to you,

Thanks. And to you as well.

Source record: 201974
Cross-posted to: rec.games.hack,comp.sys.atari.st,comp.os.os2.misc,comp.os.msdos.m

Dang.

Wouldn't you know it? In my rush to get the NetHack-- 3.1.3 patch out
to all of the people waiting with baited breath, I did something really
stupid. Ah well.

The NetHack-- 3.1.3 patch posted to rec.games.hack and alt.sources a few
days ago has a problem... It's got DOS end-of-lines. Silly me.

This means the patch will fail on all unix systems, and probably most
other systems that don't waste extra characters for end-of-line.

How can you fix this problem?

a) use Rahul Desi's "flip" program:
flip -u NH31C--.Patch
will fix your problems. Apply the patch and go nuts.

b) Load NH31C--.Patch (or NH31C--.PAT or whatever) into a decent text
editor, like emacs. Replace <NL><NL> with <NL>.

c) Wait for me to post the patch as a three-part shar file.

Sorry about the wasted bandwidth. The shar files take up less space
than the uuencoded tar file (well, when it's going between systems
anyway), but it's still a pain. I hope that not too many people have
wasted some time on this.

There was a DOS program posted to comp.binaries.ibm.pc to make Atari ST disks readable on DOS machines a few weeks ago. Check the archive for that newsgroup.

Also I recently got a demo of MacSee for the PC off of that group. As soon as I have access to a PC and some Mac disks I'll check it out. I was under the impression this program didn't work so well on STs. Perhaps it'll work better on the PC. Most likely it is just a matter of tapping a larger user base.

I can second that a Falcon can display true color pictures on a VGA monitor. That was part of I demo I was given by an Atari dealer. Unfortunately, according to this dealer, most true color demos are specifically made to work on an SC1224 or equivalent. In his opinion this is very bad since he feels Atari and demo writers should be pushing VGA for the Falcon.

Has anyone successfully run Hermes 1.10 with MiNT loaded?

On my system, uuwork attempts to create u:\uucico.par, which fails;
after that, it doesn't know about any UUCP sites, and keeps recycling
through the "waiting to dial" screen.

I don't even want to do anything nasty like expiring articles while
polling or posting articles in the middle of a poll; I just don't want
to have to stop my ray-tracing (or whatever) and reboot.

Used STe w/4MB's - $400, $100 for a monitor... that's all that's needed
for a MIDI system... That's what I used for years.

Remember, compared to a GEMulator is what we're talking about here... so
I'm talking about an ST... not an IBM...

>Sorry, but there really is no comparison.

Ok......pre-response qualifier... I'm not saying the Falcon is the be-all end-all of computing, and it certainly does not outperform a 486 DX machine in most, if not all, categories. And generally, for the price, a Falcon is probably not a killer general purpose machine. But here was the specs on how the $5000 got spent (actually, it was $6600, but I was using the price we got either with no SVGA monitor, or with a cheaper replacement for the NEC 17" multisync).

486 DX2/66 w/ VESA LB and EISA
a high-end Adaptec EISA SCSI-2 controller card ($650)
Diamond video card ($579)
500MB drive (we didn't get a price quote on the cost on this component)
8MB of 60ns RAM (no price given)
full-tower case (no price given)

I can't recall if we were quoted a price on a Pro Audio Spectrum or a Soundblaster Pro 16... I think it may have been a PAS. I wish I had the price quote here so we could get a good laugh on how quickly a dream machine eats up cash. :)

<look at my "dream" Falcon... $2100 with 8/340 setup and still no detachable keyboard... :) >

>

Why didn't you ask yourself this before you got an Atari? :) heheheheeh
No, really, kidding aside, I realize that some.. if not *most* Atari
users don't use it for MIDI. I don't know if I can really say most don't
use it for MIDI, but I would hazard a guess that judging from the fact
that we may not see PageStream 3.0 but we will have Cubase Audio, OMEGA 2,
and Emagic's Notator... well... it seems the MIDI users support their
high end software market with $$$.

<incidentally... is Pagestream 3.0 not coming for the Atari because the
market is small for DTP on the Atari or because Calamus has outsold them
and become "the standard" for ST DTP? If it is because the market is too
small, Darek might want to consider that this ST market seems able to
support several $300+ MIDI packages right now, but only 1 or 2 $300+
DTP packages... and what would that mean regarding who would the ducats
to buy his GEMulator?>

And Atari and Darek both probably have features in their boxes that you'll
never use but pay for. So that's already said and done. How many of us
would use the Falcon's Localtalk? A few. But everyone pays for it.. and it
is a "nice thing to have" (tm) because you never know when you might want
it. :)

I think it is kind of odd if Darek is able to emulate the Shifter, MMU, etc... in software that he can't emulate a 6850 ACIA in software. I can see where for timing critical uses he might run into snags, but emulating the chip itself, if he's done all the rest, should be no problem.

>Now on-board Mac emulation with 32-bit color is another story entirely! :)
>

Just ask Dave Small. :)

}> The easiest way I know of is to format the floppies on the 486PC first, and
}> then write the files onto these floppies using the Atari. The PC should be
}> able to read these without problem.

One note, though, if you inadvertantly infect the PC formatted disk
with the GHOST virus, while the _disk_ is still readable, some PC's have
trouble reading all the files. (Some only read a part of the file list -
don't ask me why!)
For eaxmple, a DOS5 disk, infected with the GHOST virus is fully
readable on about half the machines here at uni. It is almost totally
unreadable on the other half. Go figure.

Hm, at a guess, I'd say you ftp it to iastate.edu, but who can say for sure...

But definitely, you can ftp CoNnect 2.20 *from* atari.archive.umich.edu in
the Telecomm directory. I believe you need to grab both conn210.lzh and
conn220i.lzh, the 2.20 files are an update that you extract over the 2.10
distribution. The VT220 emulation in CoNnect is, as near as I can tell,
flawless.

Have you thought of calling overhead for the os functions? Of course is the
time to write the data to disk the same, but the OS does kind of internal buffering
as normally the library does. But it is faster to skip the overhead for 99 times
(when writing 100 bytes in one chunk instead of 100 single byte writes)

E>What is the current version of Before Dawn, and are any English docs
E>available?

The current version is 1.22 and english docs will be available soon (in fact I'm working on them right now). Please notice: 'Before Dawn' is shareware from now on!

E>Can Before Dawn use real MODULES, or just new image files?

I wouldn't call it "just image files". You can design your own animation without any knowledge of C or any other programming language. Real modules will be vailable in the oncoming version 2.0x (please don't me ask about the release date).

E>Also, can the Warp5 star-module use animation?

Yes! You may use different IMGs in the 'Warp5' Module, too. So far there are just my STARS.IMG and the ATARI.IMG by Jï¿½rg Granzow. Since version 1.10 'Before Dawn' uses a mask to clear any drawn picture. So all you have to do is take the ringing clock IMG and design a mask (take a look at the STARS.IMG or ATARI.IMG example or watch out for the international version of 'Before Dawn').

BTW: does anybody know the date of the Glendale Show?

Ciao,
Arne

}
} Have you thought of calling overhead for the os functions? Of course is the
} time to write the data to disk the same, but the OS does kind of internal buffering
} as normally the library does. But it is faster to skip the overhead for 99 times
} (when writing 100 bytes in one chunk instead of 100 single byte writes)

The 2nd point sounds reasonable. The answer to the first is that it
doesn't write 1 byte 1000 times, in fact unix might not write them at
all - if they're a temp. file and the file is accessed frequently
enough. TOS on the other hand, will write them, and I assume MiNT will
too.

I agree - the o/s overhead could be a major slowdown here as well.

Anyone can see the difference from copying to/from floppy under MiNT
using gnu cp or the desktop copy. advice: don't cp a huge file :-)

Simon.

>back. The partial read sounds like misalignment somewhere.

>Mike Healy

>healy@nosc.mil

Yes, sounds very much like a problem I had, too: I formatted the disks with
a PC and copied the files on that drive. My ST drive had often trouble
reading these files. But these errors were rather random and most of the
time on the outer tracks (low numbers).
So I supposed Bonnie suffers, like myself, from a slight head misalignment.

One way around it: (I used it, because I didn't have _that_ much copies)
Find the malignant tracks (eg with FastCopy).
If these are the inner ones- make your disk only half full.
If these are the outer ones- first copy some trash on your disk, then the
valuables.

Okay, okay, it's not the optimized procedure, but...

3228. QUESTION ABOUT THE STe AND SIMMS

Newsgroup: comp.sys.atari.st
Date: 1993-08-26 13:07:14 UTC
From: cris@ews207.csc.ti.com
Message-ID: <1993Aug26.130714.1381@mksol.dseg.ti.com>
Source record: 201990

My husband needs to know :

a) What is the minimum number of slots on the Mega STe that have to be filled with SIMMS (out of four)?

b) Can the SIMMS that it takes be greater than 1 Meg SIMMS?

Thanks for the quick and informative response about our printer dilemna. We bought an HP DeskJet from our now working out of his garage Atari dealer to help support him and save over $700.

Thanks in advance...

Does anyone else have a problem getting dawnauto.prg and mint.prg
to work together in the auto folder of a STE? I can have either
one alone just fine and even launch dawnauto.prg by hand after
boot, but not together in the auto folder. (I'm using mint 0.95)
By the way are there English instructions for before dawn around
anywhere?

Thanks

Timeworks does not currently run on the Falcon. I am testing a beta of a Falcon compatible version but it will a little while yet before it's available I imagine. If you just want an HD & more memory, your probably better off just buying that. a half decent HD costs around 300-350GBP. memory is expensive right now. maybe you should wait a while before getting some more. a few months back, you could upgrade to 4Mb for under 100GBP. Falcon currently costs much more so unless you have a burning need for extra res & a bit more speed or direct to HD sampling then wait a while.

>
>
>My husband needs to know :
>
>a) What is the minimum number of slots on the Mega STe that have to be filled
> with SIMMS (out of four)?
>

The answer is 2: each SIMM is 8 bit bus-wide. But the Data bus of the STs is 16 bits wide. Then, for each memory bank, you MUST have 2 SIMMs.
They are mounted in this order on the board :

```
___________________
| Bank 1 - SIMM 1 | 1
|___________________|
___________________
| Bank 2 - SIMM 1 | 2
|___________________|
___________________
| Bank 1 - SIMM 2 | 3
|___________________|
___________________
| Bank 2 - SIMM 2 | 4
|___________________|
```

In each bank, BOTH SIMMS must have the same capacity, and a bank _CANNOT_ be filled partially.
This means that you will fill Slots 1 and 3 with 2 similar SIMMS, then 2 and 4 with 2 other similar SIMMS.

>b) Can the SIMMS that it takes be greater than 1 Meg SIMMS?
>

The max size of a SIMM is 1 Meg. You can have different Bank sizes, e.g
Bank 1 = 2 1 meg simms
Bank 2 = 2 0.25 Meg simms.
Total = 2.5 Meg

So the max size is 4x1 Meg , i.e. 2 Bank x 2 SIMMS x 1 Meg = 4 Meg.

I would just suggest using CD format (as has been mentioned).

In fact, I often use that to format IBM discs (when I am out of HD
disks). It formats in about a third the time of an IBM, and lets you
format 820K (82/10). You can get even higher with ACOPY or somenthing,
but 82/10 is very reliable. I would question 84/11!

In any case, I have never had trouble with a disc I formatted with
DC Format. Get the newest version from a.a.u.e

> . . . (stuff deleted)

Dont forget a few important points. GIFs are 8 bit color files. If
you convert them to a JPEG, it IS destructive, and you still have 8 bit
color (or simulated 24 bit color).

A native JPEG is 24 bit color. So it is QUITE feasible to have a JPEG
that is much better quality that a GIF. But, most of the images around
were originally scanned as GIFs and then converted to 8bit color JPEGS.
(At 80% quality, you save a lot of space, and it looks almost identical)
Everything ideally should be scanned in 24 bit color though, which GIFs
just don't support.

re: silicoln graphics.....

Although Silicoln Graphics is good at VR stuff, I think if Atari has one good year, the Jaguar will be larger (if not, the 3D0 might for a while, but its lifespan will be shorter, as it is much less powerful).

Nintento/SGs effort sounds a lot like the Jaguar. However, it will not be out until 1995! That means they have barely started designing the thing. It should be in arcades in 1994. So what? There are already amazing arcade games out there. If it becomes a large arcade smash, that would put it in very good position to sell as a $250 unit.

But, 1995 is a while away. Atari has similar computational power, available say March (I am sure they will lag a little). If they can manage to promote the Jaguar, it should do well. If it does REAL well, then Nintendos offering will not offer a very large advantage. (It might be slightly more powerful, but not too much).

- mike

p.s. I have played on $800,000 Silicoln Graphics VR machines (i.e. SG Onyx with VR headset, etc). Atari's CYBERMORPH came fairly close in speed. (In fact, cybermorph was faster). It was doing less complex rendering, but the SGs was not mind boggling, and it was in 2 colors! Not to mention, they had a fairly close "Rear plane". (i.e. the trees would just pop into existance at a certain distance, instead of scale as you would expect). SG was running 1280x1024 resolution. Jaguar is about half of that. But, the Jaguars graphics are a fair amount better than anything available today in the game market. My point: CYBERMORPH is a killer game, killer name, etc. It could help sell Jaguars very well. We will have to wait and see if Atari can correctly market a game machine, and get 3rd part support.

A small point... WAACE in recent years was held in the Sheraton in
Reston, VA.

I was under the impression that internal politics among the user-groups
involved was actually the source of the problem. Last year's WAACE
was well attended, and considered by ourselves and other developers
to be successful.

>for a MIDI system... That's what I used for years.
>

It won't have a hard drive, though. That's one of the pre-requisites I
think for a killer system. :)

To be fair, I haven't seen many $600 PCs floating around that are "killers".
The system requirements for PCs are much more demanding for their software,
for whatever reasons we can all disagree on. :)

Plus, why should anyone buy a used ST? I mean, I don't think a $600 new
system should be like that.. long time ago, I remember new 1040STe machins
selling for $379. 4MB in SIMMS is $150. Use your $100 figure for a
monitor, and you're just barely over $600 with a new STe.

Also, an STe or TT is going to have features GEMulator doesn't emulate,
like stereo sound, MIDI, etc...

And in the case of the TT or Falcon, it doesn't emulate an '030, just an
'000 (what a moniker!) for compatibility's (and probably simplicity's :))
sake.

3240. Fair price for used Megafile 30 HD?

Newsgroup: comp.sys.atari.st

Yeah, I think internal politics was a major problem. We lost one user
group around here (AURA) because meetings apparently involved a core
group of only about 5 members. The larger group, NOVAtari seemed to
(and still seems to) do better.

I think there have been a lot of behind-the-scenes stuff going on, but
a significant part of it had to stem from the direction with which to
take the 'fest. There was discussion of scaling it back to a more humble
sort of show with no dealer involvement and taking it back to its hobbyist
roots, but the powers that be abandoned that idea.

I think it was a case of the person(s) responsible for organizing perhaps
not realizing the full impact of the budgetary constraints forced on them
when they moved the show to the Sheraton (i'll remember the name next time!).

P.S., to give you an idea of how the show used to be... I'd guesstimate that
since 1989, the show has lost about 500-1000 attendees each year.

Well, you can't compare this that way.

GIF only stores 256 colors, so there is no way how a true color image could
be stored as GIF file without loss. If you convert a GIF image to JPEG
and then convert it back to GIF, there'll be obviously visible errors:
GIF pictures are normally dithered to get around the color number limitation,
and between adjacent pixels, there'll be contrast changes normally NOT present
in `real' true color pictures (like photographs from a Photo CD).

> both are about as deluded as one can get.

I have been a faithful reader of STReports (which I have just noticed has been renamed 'Silicon Times Reports'!) for a coupla years now, and quite frankly, I am getting a bit tired of the tabloid style reporting that Ralph does of the Atari world. Maybe I shouldn't blame him too much, because covering a company as 'interesting' as Atari would be bound to turn one's mind to mush.

I have to agree, though, that I find both the 'cheerleader' and the 'basher' to be quite tiring, too. I want to send and receive objective reports on what this li'l 8 MHz ST of mine can and cannot do, with all the invective or the false praise put aside, as much as possible.

Listening to all the talk about Atari 'this' or Atari 'that' makes me think that the ST/TT/Falcon030 world is really a Rorschadt (sp?) inkblot test. It says more about the talker than the machine.

Thanks for your report on how you are making your decision to buy, now that you are saving for your next computer... be it a 486 or a Falcon030, or a Mac or and Amiga

This is the same sitchyashun that I am in. I cannot buy right now, and I am looking around at all the platforms. The surprise to be, given the anti-Atari rhetoric that has always floated around, is that an STe or a Falcon (or something based on the jaguar technology - who knows) is still in the cards. I thought that my next computer would automatically be 'industry standard' as you put it.

I will be looking around. The reality now is that ALLMURDER SHE WROTE platforms are in a tremendous state of flux. I mean, imagine buying a 486 now, and discovering 18 months from now that the Pentium is the base IBM model! At least the Falcon030 has more potential of providing a fixed base in the Atari world for years to come... (knock on wood and hope it don't rain!)

|> I guess.
|> What do you think?

I say that *IF* ATARI does the proper marketing *and* makes sure
that there's high-quality (this is very but very important) software
for the Jaguar, the Jaguar will survive. I see this Nintendo machine
doing pretty much the Jaguar stuff, it's just that if they come
out first at a better price....

But yes, Nintendo's marketting force is really huge. Atari has
scored so far perfect (get IBM to manufacture, QA, etc.) but they
have to do their part now, which scares me because I like to see
systems to survive when they are good, and the Jaguar looks damn good.

Quality Software were the first to release Ali Baba and
Heracles (there were also Apple II versions). EA bought
the rights and re-released them together as Age of Adventure.

ACS was to be released for the Apple II, IBM PC and C64. It
didn't make much of an impression on me. (and I bought it at
a deep discount).

Adventure Creator was from Spinnaker (I think)... remember
Trains?

Just to throw out some comments on the darn things, if anyone cares:

In article <primusCCDq00.tB@netcom.com> primus@netcom.com (Robert keng) writes:
>I've uploaded the following files onto wuarchive.wustl.edu:
>
>dd_trgas.zip - Type 2 TGA files of Dino Dudes
>kn_trgas.zip - Type 2 TGA files of kasumi Ninja
>ra_trgas.zip - Type 2 TGA files of Raiden
>tt_trgas.zip - Type 2 TGA files of Tiny Toons
>
>They are accompanied by appropriate text files (don't d/l them unless you want
>to waste time) located in /pub/MSDOS_UPLOADS/graphics.

Again, the tt_trgas.zip file doesn't unzip at all. I hope this gets fixed soon. The rest of the files are fine (each screen shot is about 180K-215K; make sure you have the disk space, as there are quite a bit).

I am upset that the screen shots are low resolution -- the best I saw was around 340 x 250. Either the Targa pics were scaled down from the Jaguar's 720 x 576, or the Jaguar has lower-screen-resolution modes as well. On the other hand, the colors come out just fine; some of the screens clearly look better than the SNES or Genesis.

>Kasumi Ninja and Raiden don't look exciting. Compared to other beat'em ups on
>the Neo Geo and SNES Kasumi Ninja's not even close.

Hard to tell, with only two shots of KASUMI NINJA, and one of them being a title page. If anything, it looks like an incomplete version at this point.

>Raiden looks like a carbon copy of the Arcade, but then the arcade version
>don't look that good to begin with.

I almost think that RAIDEN looks a little better than the arcade, but it could be me. There's a lot of detail and color in the sprites here. If your viewer supports it, zoom in on the shadows projected on the ground -- they're not done with a hatch, nor with an all-black sprite, but with a projection of darker pixels that retain the underlying graphic pattern. That 64-bit RISC graphics chip is not merely for show...

>Dino Dudes shows some promise. Good graphics and color use is clearly shown in
>the pix.

Sprites look a little small IMO. And if anything, the backgrounds look more impressive than the foreground graphics. But hey, it's a puzzler, who needs big frills, right? B-)

>Now, the best out of all of them is Tiny Toons. This game looks like
>it's gonna be a hit on the Jaguar. Outstanding color use, detail, and
>background (seems like a multi-level parallax scroller-action game) as well as
>artwork highlights this pix. Looks like they put a considerable amount of
>efforts into the graphics judging from the pix..

I'd like to see pics of CYBERMORPH, myself. The snippits of descriptions
that have been thrown around make it sound like it's the "showcase" game for
the Jaguar (real-time textured polygon first-person mapping? Ship-morphing
effects? HUD holographic displays? Speech? Yowch).

>Well, someone had to do it. Just hope GEnie won't charge me an arm and a leg
>for d/l them. I'll look for more Jaguar pix and hopefully 3DO pix if they
>exist on GEnie.

The effort is appreciated. I think people with access to Targa viewers
should take the time to look at them, even if it does eat up almost three
megabytes of disk space to do so. B-)

>that seem a little excessive to anyone else?

Somehow I don't think Chris plans to leave it as a packet switch.
Why specify X windows for a router? Linux could probably handle the job
running on a 386/20, maybe even an SX. A non X install on linux would
take less than 40meg unless you wanted gcc and the kernel code online.
I was running my home usenet feed with gcc and all libs and kernel code
on 64Meg, with 5 meg free. Only a 1 day expire though. ;-)

>I mean, I was using a 4 MB Mega ST
>for this purpose, long ago. Of course, I recall that an equivalently configured
>KA9Q for MSDOS weighed in around 600K, and only 120K on the ST, so I guess he
>really needs that 16MB of RAM.

Not at all. A non X linux can run on 2 meg. A bit of swapping, maybe
but there are people with X windows equiped 4 meg laptops. With a
network card you've got a portable internet site. A little quicker than
KA9Q too. ;-)
OB Falcon. From what I understand, 32 bit apps (and the linux
kernel) are larger than the same app compiled as 16 bit code. Is this
true? Can we then expect Falcon only apps to be a little more memory
hungry than their ST counterparts?

.. And of course, when all you care about is
>getting what you want to do done, you don't care how many bytes or dollars you
>wasted getting there.)

Some people like to spend money on their hobbies. If someone wants
to buy a Porshe to go to the corner store for grocerys, who cares.

>Btw, have you checked to see what your DOS-level (or Linux, since I see that
>listed down below) disk data transfer rate is? Or even the raw rate you can

>respectable, I'd guess around 1-2 MB/sec tops, with the DOS rate somewhere
>around 500KB to 900KB/sec... Speeds that even a 1985 520 ST will match. No
>comparison to the Falcon...

First you need a drive that can deliver more than 2 megs/sec tops.
These are not in the Power without the Price range. There was a thread
in comp.scsi a while back, which I wish I had saved, because I've

forgotten the numbers, where someone basicly showed that at 3600 rpm and
(mumble) sectors per track, the theoretical max k/s was under 2000.

The dos rates are about what I've seen, but linux manages to go a
bit faster. Strangely enough, using the Norton speed tester under DOS, a
Conner IDE drive is 150k/sec faster than my Maxtor scsi drive. There's a
thread on this running in c.o.l right now on this. One guy was only
getting 500k/sec on linux, then he realised he probably shouldn't
benchmark under X. After quitting X and going down to single user mode,
he was up to 1200. ;-)
Another thing to consider is filesystem speed. It doesn't matter how
fast your raw disk speed is if your filesystem slows everything to a
crawl. I know news unbatching and expiry is 100x faster under linux
compared to my ST system on an almost identical scsi drive.
With linux the rates are all over the place as there is no program
like ratehd that does bare metal speed testing and linux doesn't
provide an unbuffered disk i/o device.
Is there a dd for MiNT? If there is, could someone with a tt run
this, substituting the appropriate devices, of course? I'd sure be
interested in higher level speed test results.

time dd if=/dev/sda of=/dev/null bs=1024k count=100

>And speaking as a hacker, well, the '030 is still a far better chip to code for
>than any Intel creation, and the possibilities from the DSP are still too vast
>to define.

No argument there. When I started looking at learning Intel
assembly, I almost puked. Where are all the registers? At least gas
under linux puts the operands in the order ghod intended. And a flat
address space instead of those ugly segments.

The moral? If for some reason you do buy a pc, install linux. ;-)

Hi, what do U mean by "communicate" ?
Use the one as a terminal for the other system (to share a program) ?
Sharing files/resources (printer, tapes, scanner, whatever) ?

What do you want to do exactly ?
In a way VRoom, Falcon and Stunt Car __ARE__ programms that allow 2 ataris to communicate: to play together with both machines connected !! ;-)

You will surely communicate via RS232, but there's a "NETWORK" system using Midi connection somewhere on atari.archive.umich.edu...

ALL depends on what you really want to do...

CU later for more info !

Just about any comms package and a null modem cable would do the trick.

3270. lharc2.22...

Newsgroup: comp.sys.atari.st
Date: 1993-08-27 10:32:12 UTC
From: c0031098@ws.rz.tu-bs.de
Message-ID: <1993Aug27.103212.26616@ibr.cs.tu-bs.de>
Source record: 201947

I hope i get through the noise about jaguars :-)

I had the problem with lharc2.21 creating TEMPfiles
and leaving them in the /tmp/ directory. This should
vanish with 2.22 which i installed yesterday.
But surprise: the same problem again:
lharc a -l runen.lzs *.mf
left me without .lzs but with LHA)T(...
lharc a -l -w. runen.lzs *.mf
led to the expected result.

To do further tests, i switched to my HOME directory
(on a minixfs partition)
lharc a test.lzh *
produced a test.lzh!

I switched DEBUG on and tried the same again
no problems on am minixfs-partition
but on a tosfs:
(lharc) Frename u:/tmp/LHA...runen.lzs : different filesystems

Here we are:
with TEMP on a minixfs and the files to LHarc on a tosfs
TOS (MiNT) can't rename/move the files.

Well, i guess it is high time to leave the tosfs and go to
minixfs!

If you want only connect two ataris you can connect them via RS232 with the program CoNnect.
For more computers you can take a midi-net but I don't know the ftp-sites where you can get them.

This has nothing to do with minixfs vs. tosfs, only the fact that the
source and destination files are on different drives/partitions.
Having TEMP pointing to a different minix filesystem than the working
directory gives the same results.
Lharc is so *stupid* to not check the result of the Frename call!!

I have the old Adventure Construction Set on IBM, but I believe it was released on all systemsa. BTW, that was Stuart Smith who wrote Ali Baba. Anybody know what he's doing now?

Anyhow, ACS wasn't turn-based, but timer based. In other words, move as far as you can before your timer runs out. And different characters had different timers. That turned me off right away. It was slooooooooow, too. I heard that on a C-64 is was REALLY snoresville. (Ha ha ha!)

This is correct, though I think he was just being sarcastic (which is fine since I tend to be that way myself).

As a matter of fact, I'm using it as a multi-user public access unix machine. I don't think you can do that with a Falcon REGARDLESS of how much money you throw at it. :)

> Why specify X windows for a router? Linux could probably handle the job

In short, linux is rather lean by unix standards. It's all that extra "junk" like emacs, X, and gcc that eats all the space. It's great having lots of freely available/portable software at your fingertips.

>>I mean, I was using a 4 MB Mega ST
>>for this purpose, long ago. Of course, I recall that an equivalently configured

Yeah, just a little quicker. <grin>

> .. And of course, when all you care about is
>>getting what you want to do done, you don't care how many bytes or dollars you
>>wasted getting there.)

Yup. I think in my case the box I got was a pretty good deal in terms
of "the right tool for the job." Others may disagree, but this is
more a religious issue than anything else.

> Some people like to spend money on their hobbies. If someone wants
> to buy a Porshe to go to the corner store for grocerys, who cares.

Hehe, the guy in the Hyundai on the side of the road watching you zip
back and forth seems to care a lot, but he has illusions of taking out
that 4-banger and replacing it with a v-12 real soon now. In the mean
time, he'll just put himself into cryogenic suspension during those
multi-year trips to the corner store. Occasionally, he'll throw some
mud at your Porsche to make himself feel better so you have to drive
fast. Besides, that Hyundai has a direct to tape stereo recorder. At
least the guy can listen to tunes while he waits. :-)

>>Btw, have you checked to see what your DOS-level (or Linux, since I see that

>>around 500KB to 900KB/sec... Speeds that even a 1985 520 ST will match. No
>>comparison to the Falcon...

Hah. I haven't run iozone yet, but I am quite confident that my
EISA controller can pump bits in and out of my scsi drive much faster.
It's a sub 10ms drive with a ~5500rmp spindle speed. In short, a screamer...
Ooops, dodging that mud...

> First you need a drive that can deliver more than 2 megs/sec tops.
> These are not in the Power without the Price range. There was a thread

> forgotten the numbers, where someone basicly showed that at 3600 rpm and
> (mumble) sectors per track, the theoretical max k/s was under 2000.

Well, in a virtual memory situation like unix, it makes sense to
get as much RAM as you can reasonably afford and then get a very
fast disk. So that's what I did.

>>And speaking as a hacker, well, the '030 is still a far better chip to code for

I agree. The problem is that they're making those Intel boxes so
damned cheap it is hard to resist the temptation.

> The moral? If for some reason you do buy a pc, install linux. ;-)

Amen...

Cheers,

Chris

3279. MegaSTe - SOLD

My, oh, my ... touched a nerve, eh?

In article <88834@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
>'Scuse me George... come back down to the real world...

Real world approaching! :-)

>A'486 system can be had for a LOT less than a Falcon, and with a lot
>more USABLE features.
>

Well, sure, you can get a '486 for less than a Falcon. You can get a
Timex Sinclair 1000 for less than a Falcon, too, at a garage sale.

Remember: the Atari computer can run the *same* benchmark (256-color
Mandelbrot set) faster than a '486 running at 66 MHz. The numbers
reported from CeBIT were: '486 -- 6 seconds. Atari -- 4 seconds.

BTW -- Another poster complained that these numbers weren't "fair" because
it was using the "stock" Atari hardware to achieve this performance.
I'm not too sure where the unfairness is in the comparison. Was it
just an oblique reference to the fact that even the Disc Operating
System (DOS) is not standard equipment on an MS-DOS machine? :-)

>Not to mention that an equivalent '486 system can actually be FOUND at
>a zillion times more dealers, and software is actually *available*...
>

True (for now): the '486 system can actually be FOUND at a zillion more
dealers. And for equivalent performance, you need to spend $2500 or
more. That's certainly excessive compared to the Falcon's $1500. When
comparison shopping, I'd certainly go out of my way to save $1000!

True (for now): software is actually *available* for a '486 machine.
Would you seriously consider running it on a '286? Probably not.
(I've tried running Excel under Windows on a '286, in which moving
from one cell to an adjacent cell ... just a move ... took 3 seconds.)

True (for now): software is actually available for the Falcon.
Would I seriously consider running it on an ST? Probably.

>Do YOU do "direct to disk" recording..? If you do, you're in a tiny, tiny
>minority of computer users... why not pay for a bigger hard drive, or
>a better resolution monitor instead of features you'll never use..?
>
>BobR

Because Atari programs are more compact then their MS-DOS equivalent,
an 80 Megabyte hard drive gives space equivalent to 240 Megabytes on
a clone. GEM doesn't require 4 Megabytes of RAM and 20 to 30 Megabytes
of disc space to operate. Microsoft Windows does require all of this.

No, I don't do "direct to disc" recording. However, I do use my machine
for tracking the stock market (STalk The Market), desktop publishing
(Calamus), modem communications (Flash), spreadsheeting of payments
received (Logisitix), occasional letters to friends (ST Writer),
various utilities (ICD hard disc support, TOS patches distributed freely
by Atari), and an accessory (Card File 4).

What do you use yours for?

Anyone-

This has got to be the dumbest problem in the world. Check this out.

I have the following set-up:

- ATARI 1040STf TOS 1.0 :-<
- 2 DS/DD Disk Drives

ok,

BOOT DISK:

- AUTO/ETERNAL2.PRG
- AUTO/RAMDISK.DAT w/ "D400"
- AUTO/((GEMENV.PRG - loads SOZOBON /BIN, /INCLUDE, /HOME, etc..)
ROOT.ENV contains:
LIB=A:\SOZOBON\LIB\
INCLUDE=A:\SOZOBON\LIB\
BIN=A:\SOZOBON\BIN\
etc.....
- VI (loaded into Ramdisk)
- .c source files (loaded into Ramdisk)
- MUPFEL.PRG & MUPFEL.MUP (loaded into Ramdisk)
MUPFEL.MUP contains:
PATH=A:\SOZOBON\LIB\;D:\
CDPATH=D:\
LIB=A:\SOZOBON\LIB;
INCLUDE=A:\SOZOBON\INCLUDE\
HOME=D:\
etc.....

After the boot disk loads the gemvariables, creates a 400K ramdisk, and
copys all of the above programs to it, I replace it with a disk
containing:

SOZOBON\BIN\
SOZOBON\INCLUDE\
SOZOBON\LIB\

right! But wait.

when I am at the d:\ prompt, it WILL NOT RECOGNIZE ANY .TTP's THAT ARE
IN SOZOBON\BIN!!
!!!
so 'cc {filename}' does NOT work --------- EVER! :-< :-< :-< :-<

my notorius MUPFEL 'PATH' should take care of that!
PATH=a:\sozobon\bin\ right!!!!!!!!!!!!!
(I have spent days changing the stupid gemenv variables, and saving them
to disk properly only to ovserve the save phenomenon -
'cc: does not exist'
I even tried adding the variables in GEMENV to the mupfel.mup variables,
in essence, copying the same paths verbatim and it still says duhhhhhh,
so and so 'does not exist' or something like that.
>>>>>>>>>>>>>>>>>>>>>>>>>>>I don't want this stupid message anymore.

WHaat the heck is going on here?

Maybee I just have an incredibly STUPID shell. Can someone recommend a
get-the-job-done, good-for-SOZOBON-C shell, or kindly offer a fix for
this system? Is it my dumb TOS 1.0??

Thanks in advance.

Totally bewieldered.

I think that's the only problem.
When I brought this to Martin's attention, he said that the writer
of UUCICO is to "blame". He does not feel it is part of the Hermes
software. The writer is to be found in the docs somewhere.

K>Does anyone else have a problem getting dawnauto.prg and mint.prg to
K>work together in the auto folder of a STE?

Why? What's your problem? 'Before Dawn' (since version 1.1x) works fine with
MultiTOS (which includes MinT).

K>By the way are there English instructions for before dawn around
K>anywhere?

I finished them yesterday. English docs will be available with version 1.25
(including spelling errors ;-)

Ciao,
Arne

>
>---- Mike Winters

I like the A320 (Airbus A320 simulator).
There is a US edition with about 130 airports in the west and north-east of
the USA and the originally europe edition with 80 airports in europe (most
in uk, france and germany).
the game contains high altitude flight route charts and the original
approach charts which are used by the airlines in the real world.
i've both versions, so i someone wants more detailed infos, write to me.

if like to get a realistic flight simulator, this is a good one.
okay, the sound is very poor and graphics only show the airports and a
difference between sea and land, but no buildings, mountains etc.

if you like more the action flight simulators, this game will be boring for you.
it is just for really flight fans, who want to land at the real airports.

hope this helps

Re: connecting Atari's

There is an ACC called LittleNet that does a very good job of allowing two (but only two) Atari's to share files over a MIDI connection. I spent about $10.00 on two 5 pin DIN connectors and 50' feet of phone cable to connect an old 520 to my MegaST. The ACC allows you to select one of the drives on the remote machine to access as drive N: on the local machine. I have also swung the cables over to the Falcon and it works okay, except that LittleNET does not work with BGM (>16 Meg) partitions so that I can only read data off the Mega from the Falcon and not the other direction. The ACC also does not work with TurboST or Warp9.

I also have something called MidiNET which can handle multiple nodes, but I have not been able to get it to work.

Hope this helps,

RandyH

>someone please let me know where to find it.

`elvis' is the one. It is almost entirely 100% `vi' compatible. You can
get it from `atari.archive.umich.edu'; perhaps from other sites as well.
I'm not sure how viable `elvis' is without a hard disk, though.

I tried `stevie', but it is not more than about 10% of `vi'. If the things
it does are what you're used to, you'll love it. Otherwise, you'll want
to smash it into tiny little pieces every time it does the ``wrong'' thing.
Fingers are hard to retrain after so many years. Its scrolling is also
depressingly slow.

Repeal prohibition.

```
=======================
With the Jaguar's DSP capability, perhaps we will be able to ComLynx over
phone lines. Hmm....
=======================

Just MHO here, but, if the Jaguar can rotate and texture-map in real-time,
and it CAN. And the controller ports can support alot of different inputs
(and they most certainly do), then what is to stop you from calling your
friend a couple blocks away, each friend hooks up a virtual reality system
to the Jaguar, and then connects the jaguar to a 19" TV (unless the VR system
is nice enough to have color screens in front of your eyes, instead of LCD
glasses like the ST had).. Then you and your friend can both play the game,
except you can't see your friend. You can hear him, you can see him IN the
game and adventure through a dark dungeon with him, and hear what dierction
he is in, and even swing your sword at him and watch him bleed. Your
friend on the other side of the phone line has his own Jaguar and gets his
own view. Any ideas on a conference call? Or will be need to central
computer with a bunch of phone lines and modems to network more than 2 people?

I think it would be great - better than great - revolutionary.

Hehe .. wonder when the Jaguar card for the Falcon's PDS is coming out? Its
pretty obvious why they chose to limit the PDS to be so 68000 compatible
when you see that the Jaguar is chips controlled by a 68000 (with the 68000
and bus at 13.3MHz - wonder how fast it goes at the Falcon's 16MHz?)
```

From: Spuddy's@spuddy.uucp (unknown)
To: ag948@freenet.HSC.Colorado.EDU
Subject: Some info from Spuddy
Date: Tue, 24 Aug

Greetings !!

Thanks for your mail. Herewith a brief description of Spuddy....

Spud's Xanadu is a network of Sun Workstations, dedicated to the
provision of a free mail and usenet service for the UK. The features
available online are :-

* Loads of freeware for download. Much of it is available via Spuddy's mail
server. There is also a complete archive of the excellent GNU utilities
online.

* Two `mud' games.

* FREE access to a full unix shell. The choices of shell are :
sh, csh, bash, ksh, zsh, tcsh, ssh or rc.

* If you don't like unix - you don't have to touch it ! There is a menu
system that allows user-friendly access to the world of usenet ! Just
request a `menu' shell.

* Full access to usenet news. This (obviously) includes posting.

* Your own mailbox for worldwide internet/uucp mail.

* No limit on downloading - no ratios or silly rules. You may request
sources by post for free (providing you provide the media !)

* A friendly bbs.

* You may obtain uucp access to transfer files directly.

REMEMBER ! There are no charges for ANYTHING on Spuddy !! It's all completely
FREE !!!

Etc etc..... anyway - if you would like to use Spuddy, just call the number
below, login as bbs, and leave your details there, or mail me directly as
jamie@spuddy.uucp with :

Your full name.
Your favourite jelly baby.
An original username or handle.

Which shell you want to use (from the list above).
A password, preferably at least 5 letters long.

Your account should then be created within 24 hours.

SPUD'S XANADU >> 0203 364436/362560 << Meeeeeoooow !
^ ^
| |
Speeds up to 9600 --- --- Up to V32bis/V42bis

(There is also another line dedicated to uucp transfers)

Well, yes, that's probably true. But show me a sector of the ST community
that DOESN'T have some piracy. I think it would be hard to claim that
piracy is more damaging and rampant in the MIDI community when it seems that
that is the only group of ST owners (perhaps, other than programmers) who
can support a large number of expensive software packages.

I think the main point I am making is that MIDI users seem to be spending
enough to keep expensive and competitve packages coming. No other group of
Atari users seems to be plunking down as much cash. So it seems that is a
pretty good argument for Darek to add MIDI to GEMulator...

(and come to think of it, programmers may not be big spenders as we only
seem to have 1 commercial C compiler widely available in the USA, which is
Lattice C... I remember when we had Megamax/Laser C, Mark Williams C, AND
Lattice C...)

I would agree because he's demonstrated he's a good programmer... But I'm
wondering whether it would even be possible, considering that from the mailing
he sent (thanks, Darek!) it seems that there is no way <-- famous last words :)
to make the timing perfect on a wide variety of PCs, especially considering
that on a low-end machine (in his mailing, he said a 486SX/25 runs about as
fast as an Atari ST 8mhz 68000) might have problems keeping up through the

emulator.

>>>Now on-board Mac emulation with 32-bit color is another story entirely! :)

>size, etc... On the other hand, the raw components are the same, and cost the
>same. Why buy a PC with 8MB of RAM, when you could simply put 8MB into your ST?

Total nonsense Howard. Give me some numbers. Real hard numbers. Yes you can
put 8 meg into an ST. FOR HOW MUCH? Yes you can upgrade the video to
Moniterm or ISAC or Crazy Dots. FOR HOW MUCH? Yes you can upgrade to TOS 2.06
or MultiTOS. FOR HOW MUCH? Yes you can upgrade to a high density floppy.
HOW MUCH? A larger hard disk (I fail to understand how people can talk about
direct to disk capabilities of the Falcon when the stupid thing comes with
way too little RAM and hard disk space to be useful. Again more cash for
a real Falcon). You can get a 16 Mhz or 20 Mhz upgrade for the ST. HOW MUCH?
You can get a 386 emulator. HOW MUCH?

HOW MUCH HOWARD??????? HOW MUCH MONEY DO ATARI USERS NEED TO KEEP THROWING
INTO A BOTTOMLESS PIT HOWARD?????????

The kind of people who buy Gemulator are both the type you describe (mondo
investement in Atari hardware) as well as the type who have a minimal
520ST or 1040ST system and just are not willing to shell out $1000+ to
get a new Mega STE or Falcon. They need a more powerful machine to run some
of the newer ST software. So what do they do?

A person has lots of options to get a more powerful piece of hardware to run
their ST software on. We're no talking about someone who specifically
wants to buy a Falcon because they want to tinker with the DSP or a developer
who buys a Falcon to test software compatibility on. We're talking about
your average Atari user who to date typically goes through great lengths to
get a decent system out of his ST - 16 Mhz upgrades, PC emulators, large
monitors, memory ugprades, etc. Here are 4 options:

1 - upgrade the existing ST. After butchering the ST to pieces (a nice
little side effect of a closed system like the ST) you're looking at
$1000+ for upgrading to the equivalent of a decent Mega STE or Falcon.

PC emulation extra. Good luck if anything ever breaks down.

2 - buy new Atari hardware, like a new Mega STE or Falcon. $1199 for a bare bones Falcon, + hundreds for a monitor, + hundreds of a decent RAM and hard disk upgrade. PC emulation extra. The "under $1000 68030 machine" Atari promised us years ago is now $2000+. Accoring to one magazine review out of Europe, the Falcon has a 40% compatibility rate with ST games and 70% with non-games. Put more money in the pockets of the Tramiels so they can use it for more stock flips and fund their future game machine projects (the "new" direction of the company? not that it's ever been anything otherwise!)

3 - buy a Mac. Hey, for what you pay for a 68030 based Atari running MultiTOS you can get a 68040 based Mac running System 7 with full color graphics and high density drives. Remember Dave Small's wonder emulator doesn't quite support any of that, so to run Mac software written since Ronald RayGun left office, you gotta but the real thing. Even I have a Mac at home. Major drawback: 0% Atari compatiblity.

4 - buy new PC hardware with Gemulator. $1500 to $2500 for a complete 486 system depending on what system you get and from which dealer. Full PC emulation is included <grin> and compatibility with non game and non MIDI software is almost 100%, better than the TT or Falcon. Some Atari dealers themselves sell 486/33 systems (complete with monitor and hard disk and Gemulator with TOS 2.06 ROMs) for about $1500. Add $500 to $1000 for a localbus 486/66 machine which will run as fast as a Falcon, and give you full support for DOS, Windows, OS/2, NT, UNIX, and whatever else comes along. I haven't seen IBM or Microsoft or Sun or Apple talking about porting their OSes to the ST, have you?

Sure, there's arguments for all 4 cases, with you obviously being a big supporter of #1. But your argument is only the lazy man's bandaid solution. A year or two when the ST market gets even deader, when more dealer shut down or covert to other platforms, when more ST magazines die, when more user groups break up, you'll be looking for a new computer anyway. So you'll end up going with #2, #3, or #4.

I welcome a discussion of pros and cons of all of the above methods. But please back it up with something solid like prices instead of just saying "well you can do this and you can do this and you can do this". You can grow watermelons in your car's trunk if I want to but you don't do it without a reason.

Hi!

O>BTW how can i use an slm on a falcon ????
Ooops! I think, that schould be difficulty due to the missing ACSI-Port.
If there's anybody having a SCSI (II) --> ACSI Adapter, he should mention this
once in a while because I've read many sad mails of people havin' a Falcon and
a MAC-Emulator needing this ACSI-Port too.

Bye
Stefan

PS: Correct me if I'm wrong thinking that slm's need ACSI ...

Hi!

R>So, my question is "Is there any program that emulates a mono monitor?"

Yeah! Run and take a look for SEBRA, one of the best mono-emulators I've seen
in my ST-times :-)
This is one that is quite fast and comfortable to be configured.

You can make many different preferences such as the following:

- Mouse-Speeder
- Colo(u)rs (Only White and then another chosen from four different
colo(u)rs) - sorry for the '(u)' :-)
- Emulation-Speed

R>Or do I have to buy ANOTHER monitor in order for ALL my applications to
R>run correctly?

THAT would be much better. A SM124 (others from Atari too) would be best.

Bye
Stefan

Hello guys,

I have just arrived in the US and I am seriously considering buying a Falcon after using the Mega ST for 3 years. However, at the time that I last heard about the Falcon, they were just starting to ship the set.

I would hence like to know more from users of the Falcon on what are the great things about it as well as the problems. Is it worth its price? I was quoted $1299 for a 4/65 configuration but I thought that was quite expensive. What is the market price for the Falcon? And have they released those with new casings yet?

I am looking forward eagerly to try out the speed of the Falcon as well as the DSP chip. Hope that I can know more and get one soon though.

Thanks!
Electronic greetings,
Michael Fung

What I would like to do is interconnect several computers in such a way that files can be transferred and/or shared.

The software should be simple and easily portable; the hardware required should be limited to a serial port. The machines might include virtually anything - CP/M, Atari, Amiga, 6809, and whatever, even small SBCs.

Has anyone set up such a configuration? We've discussed the following possible approaches:

1. KA9Q TCP/IP using SLIP. Routing programs would run on multiport machines.

2. Using a small SBC to convert between RS-232 and a 9-bit network.

3. UUCP.

What I do in my setup now is use Xmodem. It seems to be the only common transfer protocol. I'd like to change to Zmodem, but by the time I do that it might have been easier to port UUCP.

This would appear to be a common problem, though. I imagine someone out in netland has already solved it, at least partway. How did you do it?

ISAC's were being blown out for $299, if I remember correctly.
The more promising video upgrade I've seen are the Lexicor NOVA cards which
are essentially modified PC VGA and SVGA cards. These go for between $300 to
$1000.

I am not aware of an 8MB expansion for the ST series, but I would be interested
in one if it is cost-effective.

High-density floppy add-on... apparently some have do-it-yourself (< $80)
upgrades for it, as well as commercial (<$130) upgrades.

TOS 2.06 is $140 using the TEC board.

Add it all up and the typical ST user might scratch his or her head and
consider a $799 Falcon which (as you say) has too little RAM and HD space
for direct-to-disk recording. :)

>HOW MUCH HOWARD??????? HOW MUCH MONEY DO ATARI USERS NEED TO KEEP THROWING
>INTO A BOTTOMLESS PIT HOWARD?????????
>

Well it would cost less than to buy a 486SX/25 + GEMulator. :)

(However, the reality is, those who buy a GEMulator would have other uses
for the PC that would probably justify the system purchases other than to
emulate an Atari at 8mhz speed)

>The kind of people who buy Gemulator are both the type you describe (mondo

>

Well, Darek, if they can't afford $1000 for a system, then they can't afford
a 486/SX25 with a "good" VGA card in order to do decent ST emulation with the
GEMulator.

I think they can afford it.... I think they may not want to spend more than
$1000 on an Atari, but may go higher for a more permanent machine like a Mac
or PC clone.

Also, do you imply that GEMulator offers a more powerful platform than the
Falcon?

(I'm not sure you could adequately back that claim, even with a 486 66mhz box)

>A person has lots of options to get a more powerful piece of hardware to run

>

That's true. But the same can be said for almost any small company's hardware
support, especially for older machines. If someone has a 4 yr. old PC and
brings it in dead to a clone dealer, they will most likely "fix it" by doing
a motherboard swap.

>

Ok, a correction.. the "bare bones" Falcon is "only" $799. But I think it
is quite unusable.

I think the "base system" is the 4/80 system selling for $1200.

For $1200, and I speak only for myself, I'm not playing games. I really would not care if Dungeon Master works on it. I'm also sure that GEMulator would not be able to run many of the ST games because they come on copy protected disks.

I think in a sense, your presentation of the first two options somehow implies GEMulator can do these things... which it cannot.

>3 - buy a Mac. Hey, for what you pay for a 68030 based Atari running

That's true. But then, if you're buying a new computer, and you still have an ST and enough desktop space, there is no reason not to buy a Mac. :)

> UNIX, and whatever else comes along. I haven't seen IBM or Microsoft
> or Sun or Apple talking about porting their OSes to the ST, have you?
>

Ok, here are some things I kind of take issue with in your presentation:

1) $1500 for a complete 486/DX33 system is about right. That includes (usually) a SVGA card (a good one, too), 200MB HD, mouse, and 4MB of RAM. Assuming GEMulator takes up no RAM, this would give the user emulation of (roughly) 16mhz 68000 with no sound support, no MIDI, no joystick, no ability to read/write protected floppies, and it might be a tight fit to try to run GEMulator along with something else.

If the user's goal is to buy a high-end ST, for $1500, they would do better to just buy a TT030. Or a Falcon. In fact, looking at your mailing information, it says a 50mhz 80486 emulates roughly a 16mhz 68000.

The issue then is simply whether or not it is worth it for the end user to switch. If all they want (or need) is a fast ST, I don't think GEMulator can deliver unless it is running on a Pentium. A 16mhz 68000 was nice a while ago (and I'm using one now, so I guess I'm qualified to comment on it) but I feel that a 16mhz '030 is probably the bare minimum for someone doing serious work. The Falcon should have had a 33mhz CPU, IMHO.

If on the other hand, the user wants to escape the downward spiral of Atari computers (whether real or percieved... I think it is real enough), then

they will go PC or Mac, and if they need GEMulator to make the transition smoother, that's where the product comes in. But I think it is a little presumptuous to put an emulator of a 16mhz 68000 up against a machine with a 16mhz '030 and a 33mhz 56001 DSP and other enhancements as the option for an *Atari* power user. A PC power user would indeed enjoy a 486/66 (I'm going to definitely enjoy mine when i get it :)).

2) I've also noticed you have made claims at various times that you've sold more GEMulators than Atari has sold Falcons. Judging from the response at local music stores... I'd hazard a guess you're probably wrong. :)

3) The people who upgrade to a Falcon can "take along" their ST monitor. They can also bring up their hard drives, modems, etc... albeit with different cables, and perhaps even support software. But it is not a completely new system purchase like a PC, where the SC1224 would be useless as a monitor, or a SCSI drive might require additional purchases because that $1500 system only includes IDE, not SCSI.

I think you've got a nice product and I think it is probably an excellent job of emulation. I do think it has some things missing I wish were in it (MIDI!), but overall, it is a killer product. I just think it isn't realistic to claim it is comparable to a high-end Atari (i.e., Falcon or TT) in overall features and performance because it lacks a lot of the features of those particular boxes, and as I've said, if the user wants a high powered ST, they are probably stuck with Atari products. Perhaps as GEMulator is upgraded and faster Intel CPUs become cheaper (a Pentium should be able to give TT performance) you could eliminate Atari's high end. :)

>But please back it up with something solid like prices instead of just
>saying "well you can do this and you can do this and you can do this".
>You can grow watermelons in your car's trunk if I want to but you don't
>do it without a reason.

Well, let me summarize it all.. into a neat paragraph or so.

GEMulator is great. I think it is perfect for someone using an 8mhz ST machine, or maybe even STe, who is sick of Atari's so-so performance in the comptuer industry and wants to jump to a more secure platform.

But if the user needs a more powerful ST, I don't think a 486/66 running like a 24mhz 68000 is going to be enough. I think in that case, they would do better to get a Falcon or TT.

Also, I'd love to see you add MIDI support. I know you've said no one has made a big deal of it, so let me be one of the first to whine about it. :)

3311. MasterBrowse 2.8 *UPLOADED* (a.a/c.b.a.st)

Newsgroup: comp.sys.atari.st
Date: 1993-08-28 07:02:14 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.O9vBdwAP_9w@elfhaven.ersys.edmonton.ab.ca>
Source record: 201517

```
M a s t e r B r o w s e 2 . 8
""""""""""""""""""""""""""""""""

Copyright 1993, Michel Forget
Electric Storm Software

There is a new version of MasterBrowse available!

The file (MB28_BIN.ZOO) has been sent to atari.archive.umich.edu
(and will be available as soon as the archive maintainers process it). It
has also been sent to comp.binaries.atari.st for distribution. In addition,
the file will also be uploaded to ftp.cs.tu-berlin.de and ftp.tu-clausthal.de
over the next few days.

For those who have never used MasterBrowse before, a detailed description
of the program will follow this list of new features and bug fixes:

~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~

* A text formatting problem was fixed; "Print Block", "Clip Block",
and "Write Block" all appeared one column to the right of where they
should have appeared.

* The "Jump -> Page" feature has been fixed again; it now considers a
page to be the number of lines on a printer page (you can set this in
the "General Options" dialog box).

* There is a new command line option; "-gemini" prevents Gemini from
conflicting with MasterBrowse (system crash). To make the process of
adding "-gemini" to the command line transparent to the user, a .MUP
script has been placed in this archive. Simply install the .MUP script
as an application instead of MBROWSE.PRG (and be sure to edit the
filename in the .MUP script so that it knows where to find MBROWSE.PRG).
Next, set the following two Gemini application controls; "it is a GEM
application" (this will prevent Gemini from playing games with the
mouse pointer) and "close all windows on startup" (this will prevent
Gemini from opening the Console window to execute the script). When
installed properly, this entire process is transparent to the user.

* There is now a second popup window menu; if you double-click on any
line inside a MasterBrowse window, a subset of the "Position" menu will
appear on the screen.

* A bug was fixed with right scrolling; with a document that was not as
wide as the window, you could scroll to the right anyway.

* A bug was fixed with left and right scrolling with the window arrows;
the bell would not sound when the user tried to move beyond the
```

boundaries of the document.

* A bug was fixed in the keyboard routines; pressing ALT-L had no effect, when it should have been calling the "Jump -> Line" function.

* A bug was fixed in the "Find" dialog box; selecting "Cancel" now exits without changing the search strings, or the status of the searching options.

* MasterBrowse is now completely resolution independant; it can redraw the screen using RASTER COPIES (very fast and smooth) in any resolution now.

* MasterBrowse can now use GDOS monospaced fonts in text windows. Changes made to the GDOS settings will not take effect until the next time you enter MasterBrowse, or until all windows have been closed.

* MasterBrowse no longer draws new text windows twice the first time they are displayed.

* The "Set Options" dialog box has been altered (along with the dialog boxes that can be accessed through it). Each of the sub-dialogs now exists as a function that can be selected from the main menu. This makes it easier to change your options.

* A bug was fixed in the line selection mechanism; when the user clicked (or double-clicked) on a line, the highlighting obliterated the text on the line. This only happened if "inverse" was selected as the method for drawing block marks.

* A scrolling bug was fixed; in MasterBrowse 2.6b you could scroll past the end of the file, which would cause a system crash. This is now fixed.

~ ~

Everyone who owns a computer has, at one time or another, needed to view the contents of a text file. The text file viewer supplied with Atari computers will allow you to do this, but it is lacking in many respects.

MasterBrowse is a replacement text file viewer for any Atari computer, in any resolution with a size greater than or equal to 640 X 200. It offers many features that the Atari text file viewer does not:

* MasterBrowse works with MultiTOS, and should work with other multitasking operating systems for the Atari, such as MultiGEM, Mag!X, and Geneva.

* MasterBrowse has an extremely fast GEM user interface, which makes use of raster copy screen updates, GDOS fonts, pull down menus, progress displays, windows, optional non-modal dialog boxes (and alert boxes), and more. MasterBrowse also provides keyboard equivalents for

every single function.

* MasterBrowse allows you to have a virtually unlimited number of documents open at the same time, restricted only by the number of free window handles and the amount of memory available.

* MasterBrowse can use the command line (of course) to open documents (or open a document batch). The ARGV, xArg, and standard command line formats are supported.

* MasterBrowse allows you to use all of your familiar movement keys. You can use the arrow keys, the application keypad, or the space bar and the return key.

* MasterBrowse allows you to move in any direction inside a document, as you would expect. What you might not expect is that you can tell MasterBrowse how far it should move when the movement keys are pressed. How about moving two lines down instead of one? or perhaps three lines suits you better?

Do you still want more? Keep reading.

-You can jump to a specific line, a specific page, the start of a block, the end of a block, or any of ten personal "bookmarks" that MasterBrowse supplies for each window.

* MasterBrowse also offers you the ability to search for up to three strings at the same time inside a document (case sensitive or case insensitive), starting at the top of the document or the current position. If a search is performed starting at the current position within the document, MasterBrowse can be told to search in forward mode or reverse mode. After the string is found, another command may be used to find the next (or previous) occurrence of the string. When strings are found, they are placed in the centre of the screen and highlighted.

* MasterBrowse also has block functions. You can mark a block off, and then save it to disk, print it, or write it to the clipboard. You can decide how the block is marked on the screen. MasterBrowse can also be told to remove the block markers after a block operation is completed. Blocks are marked using the -MOUSE-. More? A block can even be extracted from a larger document and placed inside a MasterBrowse window!

* MasterBrowse is a master printer. It can print a document (or a block) with page headings, page numbers, line numbers, a description of the file or block, or a combination of the four. It can even print an identification string for those people who share a printer between more than one computer.

* MasterBrowse gives you complete control over your windows. You can cycle through them, change their titles, shrink them, close one, close them all, or get information about them all from the

keyboard (or the mouse).

* MasterBrowse saves the positions of the first seven windows, so you have complete control over where your documents appear and how your screen looks.

* MasterBrowse allows you to load and save different configuration files.

* MasterBrowse allows you to load and save bookmark lists.

* MasterBrowse displays (optional) progress maps, just like the GEM Desktop.

* Every window has a set of block markers and a set of ten bookmarks to itself.

* MasterBrowse supports batch files! If you use a certain group of documents often, just load them up and tell MasterBrowse to create a batch file. One double-click on the batch file, and they will all be loaded again.

* MasterBrowse also has support for the clipboard! A block can be written to the clipboard (with or without formatting) or the clipboard can be read into a MasterBrowse window.

* MasterBrowse allows you to interface (transparently) with as many as four external archivers, so that you can save space by storing your files in a compressed format.

* MasterBrowse allows you to move through a document (by lines or pages) using a special Quick Scroll Mode. It uses the shift, control, and alternate keys so that the scrolling speed is not limited by the key repeat speed.

* MasterBrowse allows you to remove the vertical window scroll bar, the horizontal window scroll bar, or both scroll bars. In addition, each MasterBrowse window can have different scroll bar settings.

The features listed above barely scratch the surface of MasterBrowse!

3312. UUCODER 4.4 *UPLOADED* (a.a/c.b.a.st)

Newsgroup: comp.sys.atari.st
Date: 1993-08-28 07:05:08 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.w8DZPdKaBMM@elfhaven.ersys.edmonton.ab.ca>
Source record: 201519

```
------------------------------------------------------------
| ESS UUEncode/UUDecode 4.4 Electric Storm Software |
|----------------------------------------------------------|
| MultiTOS COMPATIBLE |
|__________________________________________________________|
| Copyright 1993, Michel Forget |
------------------------------------------------------------
```

There is a new version of ESS UUEncode/UUDecode available!

The file (UUCODE44.ZOO) has been sent to atari.archive.umich.edu
(and will be available as soon as the archive maintainers process it). It
has also been sent to comp.binaries.atari.st for distribution. In addition,
the file will also be uploaded to ftp.cs.tu-berlin.de and ftp.tu-clausthal.de
over the next few days.

For those who have never used ESS UUEncode/UUDecode before, a detailed
description of the program will follow this list of new features and
bug fixes:

~ ~

* The program was not closing (or opening) the VDI workstation properly,
which caused some systems to crash, and prevented TT systems from
moving the window dialogs around the screen.

* The stack size was not large enough to handle many-segment UUEncoded
files. This only became a problem with really _huge_ files.

* The program did not work properly when the user tried to open more
windows than the system would allow.

* The resource file has been changed slightly.

* There is a bug in TOS that prevents ESS UUEncode/UUDecode from
finding its configuration file if it is run from a directory other
than where it resides. If you have a desktop that allows you to pass
fixed arguments to an application (TeraDesk/NewDesk), you can solve
this problem by adding "C=filename.ext" (where filename.ext is the
location of your configuration file) to the list of fixed arguments
to pass. ESS UUEncode/UUDecode will immediately load and process the
named configuration file when this argument is supplied.

* Complex filenames are no longer truncated or corrupted.

* In all previous versions of this program (even the versions not
written by me), there were serious file handling bugs. These bugs
have been fixed in this version. ESS UUEncode/UUDecode now uses the

following rules:

(no explicit destination path specified)

D:\COMM\FOO.LZH ==> D:\COMM\FOO.UUE

(explicit destination path specified)

D:\COMM\FOO.LZH ==> E:\USER\PATH\FOO.UUE

In both situations, the output file(s) will contain references to the source file as if the output file(s) were being written to the same directory as the source file. This means that even if you explicitly declare the destination path, the output file(s) will contain lines like "begin 644 D:\COMM\FOO.LZH" and "include D:\COMM\FOO.uab" instead of "begin 644 E:\USER\PATH\FOO.LZH" or "include E:\USER\PATH\FOO.UUE". This situation can be avoided by de-selecting "Include Paths" from the menu, which will cause the output file(s) to have lines like "begin 644 FOO.LZH" or "include FOO.Uab".

* The program now has a message window! This was added so that if an operation failed, multitasking would not be interrupted by an alert box appearing on the screen. It can also be useful for showing you the results of the last few operations.

* The program can now be told to prompt the user (using the file selector) for the name of each piece of a file to be decoded. This can be extremely useful for Hermes UUCP users, who (until now) needed to copy the segments of a file to be decoded out of their news directories and rename them appropriately.

* A bug has been corrected; previously, if the user ran the program (to use it interactively) and tried to decode a file that was not in the home directory, ESS UUEncode/UUDecode would complain that there was no data in the second segment. Now, it checks the "include" line to see how it should behave. If there is no path delimiter (\) in the "include" line, it will search for the next part in the same path that it found the first part. If there is a path delimiter, the filename in the "include" line is used as it is found.

* There is a new command line option; "-gemini" prevents Gemini from conflicting with ESS UUEncode/UUDecode (system crash). To make the process of adding "-gemini" to the command line transparent to the user, a .MUP script has been placed in this archive. Simply install the .MUP script as an application instead of UUCODER.PRG (and be sure to edit the filename in the .MUP script so that it knows where to find UUCODER.PRG). Next, set the following two Gemini application controls; "it is a GEM application" (this will prevent Gemini from playing games with the mouse pointer) and "close all windows on startup" (this will prevent Gemini from opening the Console Window to execute the script). When installed properly, this entire process is transparent to the user. If you are a Mupfel user, you should use the following line instead:

alias uux 'LOCATION_OF_UUCODER.PRG -gemini'

You will not need the .MUP script, since this line does exactly the same thing. This is _not_ a problem with Gemini. The Heat 'n' Serve "C" compiler has a corrupted startup module. When there is a new version that fixes the problem, none of this will be required.

~ ~

ESS UUEncode/UUDecode 4.4 will allow you to convert binary files to ASCII text files, or return ASCII text files to their original binary state.

Why on earth would you want to do this?

Well, the answer is simple; when computer networks such as the Internet were created, no provision was made for exchanging binary files.

In order to fill this gap, UUEncode & UUDecode were created. Although this was done a long time ago, not much has changed. The networks still require files to be transmitted in an ASCII format, and people are still required to use UUEncode & UUDecode if they want to exchange binary files.

Why should you use this version instead of one of the other ten or twenty currently available?

Here are four good reasons:

a) SPEED - ESS UUEncode/UUDecode is much faster than other coding programs that I have tested. In some cases, the difference is as much as 350%!

b) APPEARANCE - ESS UUEncode/UUDecode uses GEM! This means that you are given a nicely formatted progress display (which shows the output file, the input file, the currently active parameters, the source and destination path, and a percentage meter that indicates how much of the current file has been processed), and a message window (which displays the results of encoding/decoding operations). Since it is a GEM program, you can access your desk accessories at any time, and set your options using pull-down menus. ESS UUEncode/UUDecode uses NON-MODAL window dialogs, so you can use your accessories even while inside a dialog box!

c) COMPATIBILITY - While UUEncode & UUDecode have remained roughly the same, the Atari ST has not. ESS UUEncode/UUDecode has support for the ARGV command line standard that Atari has put forward. It also has support for the Mark Williams C xArg command line standard, and the default command line standard used by older ST systems.

d) ESS UUEncode/UUDecode has more options than any other encoding or decoding program available for the Atari.

3313. MasterBrowse 2.8 *URGENT!!!*

Newsgroup: comp.sys.atari.st
Date: 1993-08-28 07:12:56 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.kDvCAMpdLfo@elfhaven.ersys.edmonton.ab.ca>
Source record: 201523

Hello,

When creating the MasterBrowse 2.8 archive, I blundered. The .INF file inside the archive is corrupted, and will most likely cause a system crash. Simply DELETE the file, and create a new one. That will solve the problem.

There also appears to be an incompatibility between MasterBrowse and ZOO, which causes some very strange problems. This does not happen with any other program, which leads me to believe that the problem may be with ZOO.

If you were lucky enough not to have downloaded the bad archive, there is a new (correct) archive being sent out as this is written. The new filename is MB281BIN.ZOO and will be available at atari.archive.umich.edu soon.

If I get a message through to the comp.binaries.atari.st maintainer before the bad archive goes out, it will be replaced with the new one. If not, remember that all you have to do to fix the problem is delete the .INF file as soon as you get it.

I apologize for the inconvenience.

I have the following hardware/software for sale. I am interested in
getting rid of it *all* and would be very reluctant to split it up.
Atari 1040 ST
B/W Monitor
Color Monitor
Monitor Switch
20MBYTE hard disk
External 3.25 inch drive
External 5.5 inch drive
Much software including Mark Williams C and the Beckmeyer Developement
System, NEO, Degas Elite, Auto CAD,.....
512K Ram disk which fits in the Carttridgle Slot
Asking $900 or the best reasonable offer.
Please contact
David DeGeorge

From: kosmatoo@IRO.UMontreal.CA
Message-ID: <1993Aug28.165343.29804@IRO.UMontreal.CA>
Source record: 201837

In Montreal, price $1800 (US $1368) for a 4/80 falcon
In Ottawa, $1650 (US $1254) for a 4/80 falcon

2.5 months ago, a store was willing to order them for $1400 (US $1064),
but in a city of over 3 million... only one or two people were willing
to order, so the store did not do meet the $5000 U.S. minimum purchase.

** How much have you payed for _your_ falcons_? (or price in your area) **

What's the Falcon PDS???

The only thing the Falcon has that I wish my Amiga 4000 had is
that 16 bit DSP... I want to see those Falcon demos where you zoom through
fractals in real-time..

Strange that so few people wanted 'em... Over here in Toronto, when my dealer had a Falcon demo (about January), I was shocked when so many people came to see it...(the store was literally full for the 2 days my dealer had it...) and even wierder, they were all clamouring for one! Right now, my dealer only has a demo unit ($1700/1800..can't remember) and already someone has offered to buy it...It's 4/80 btw. Sheesh, does anyone out there know a falcon dealer in Toronto who actually HAS a stock of falcons (i.e. selling 'em) ?? I'd really hate to trek up to Ottawa just to buy a Falcon...!

I think in these gloomy days of Atari, 90% may be a bit low... ALL I'VE HEARD REFERENCE TO IN REGARDS TO ATARI NOW-A-DAYS HAS BEEN MIDI RELATED! Whenever I hear of someone doing some studio work, the Atari has been mentioned a majority of the time! They still plan on releasing some beefed up MIDI machine in the future or so I've read.

In regards to the sucks for anything else remark... wellll... other machines have finally surpassed it, took IBM/compat. software people YEARS to come up to the 1988/90 level of the ST. Look at the 3-d graphing programs it had when Harvard Graphics was stalling/screwing around! How about the CAD/3-d drawing capabilities Disney/MGM even used it for! Remember the red/blue "actual" 3-d software out? Needed to buy those silly goggles, but they had games, cad/drawing utilities, etc. for it! If the IBM software developers hadn't gotten off their asses and looked at the real world, that 'ole 68k might've still been big news!

Poor thing is outdated, but it's still big news in the recording industry!

: What I would like to do is interconnect several computers in such a way
: that files can be transferred and/or shared.
:
: The software should be simple and easily portable; the hardware required
: should be limited to a serial port. The machines might include virtually
: anything - CP/M, Atari, Amiga, 6809, and whatever, even small SBCs.
:
: Has anyone set up such a configuration? We've discussed the following
: possible approaches:
:
: 1. KA9Q TCP/IP using SLIP. Routing programs would run on multiport machines.
:
: 2. Using a small SBC to convert between RS-232 and a 9-bit network.
:
: 3. UUCP.

You don't say if you want the transfer to be synchronous or asynchronous.
UUCP is a spooled system, with files transferred only when machines are
in contact. TCP/IP is a protocol - I assume you are running some sort
of network OS over it - and the 9-bit network you mention sounds as if it
already had some sort of NOS. None of these approaches do the same things
the same way; networks based on them look radically different.

I suppose I'm not really clear on what you want to do. File transfer is
one thing, file sharing is another and on the whole more difficult thing.
What do you want to do with the files once you've transferred/shared them?
How far are the networked machines from each other?

Will

I have used MicroSoft Works before <gag>. I guess it alright, the price
is certainly interesting. At any rate, the main thing I wanted to say is
that I picked up AtariWorks for $89.95... certainly not too much more than
MS Works and, IMHO, a far superior program.

Nope, some people have had race conditions when starting a shell out of
GUS. The rest seems to work fine...

>When I brought this to Martin's attention, he said that the writer
>of UUCICO is to "blame". He does not feel it is part of the Hermes
>software. The writer is to be found in the docs somewhere.
The current maintainer of the UUCICO 3.72 is Ole Marienhagen, his mail
adress is ole@murphy.sh.sub.org. But that problem may also be a flaky
configuration because the uucico is said to be MiNT compatible since
3.5 or something.

On the other hand, why don't you use Juergen Lock's (nox@jelal.north.de)
port of Taylor uucico 1.03? It might be a little tricky to combine
Juergen's port with Hermes since Hermes doesn't have a "real" uuxqt
(it's build into rmail, rnews and rsmtp) but it is definately worth
the work.

Hello technically inclined Atarians!

I would like to do a memory expansion on my 1040ST. The problem is that I don't have the MMU described in the files on atari.archive. The part number of my MMU is:

C101601-38

It is an 80 pin, rectangular, surface mounted chip. I have been told that this MMU has the extra address line to address up to 4 megs of RAM. The person who told me this does RAM upgrades but he wasn't willing to share this information with me. He'd rather I pay him to install a commercial upgrade board. If anybody knows the pin outs of this chip, I'd appreciate the information so I can do a DIY upgrade. Thank you!

Thats why I'm using the Taylor uucp. I'm using version 1.03 but someone
has also done the job for version 1.04. I couldn't get my hands on the
new port.

3328. Atari.archive mirrors

Newsgroup: comp.sys.atari.st
Date: 1993-08-29 15:34:30 UTC
From: weiner@terminator.rs.itd.umich.edu
Message-ID: <25qia6$d2@terminator.rs.itd.umich.edu>
Source record: 201706
Cross-posted to: comp.sys.atari.8bit,umich.archives,comp.sys.atari.st

Many people have sent me questions regarding available mirrors and
frequency of updates. Well, here's the scoop, to the best of my knowledge.

Mirrors and frequency of updates:

wuarchive.wustl.edu:/mirrors/archive.umich.edu
-Updated nightly.

info2.rus.uni-stuttgart.de:/afs/umich.edu/group/itd/archive
-Direct afs link, updated instantaneously.

archive.orst.edu:/pub/mirrors/archive.umich.edu
-Updated nightly.

src.doc.ic.ac.uk:/packages/atari/umich
-Updated nightly.

Please note that uploading is not permitted on any of these mirrors.
Uploads must go directly to atari.archive.umich.edu.

If you know of any other site mirroring a.a.u.e, please contact
me to let me know.

If you have an afs site willing to accept ftp to archive.umich.edu,
please contact either myself, or myke@archive.umich.edu.

3329. Accelerate that ST!!!!!!!!!

Newsgroup: comp.sys.atari.st
Date: 1993-08-29 18:26:06 UTC
From: Spencer.Davies@mettav.royle.org
Message-ID: <746770260.1@mettav.royle>
Source record: 201885

Well I am currently undergoing a few small problems on my ST!
It is an STFM with a Reflex Graphics board fitted and what I am
suffering is that one minute Warp 9 works then it stops and NVDI starts
working!
I always used Warp 9 then one day it started giving corrupted displays so I
reinstalled it off the original disk but to no avail! (I even tried it on my
machine just running REFDRIVE (the Reflex software) and Warp 9 in different
loading
order)!
So I went away and bought NVDI 2.5 on recommendation which has worked fine up
until recently when it underwent the same problem as Warp 9 and I tried
everything I could think of to get it working.
The funny thing now is that NVDI no longer works but Warp 9 is working again,
so has any one got any explanations/suggestions for this strange
phenomenon????

Hi guys,

It's bin a while since I got into the atari stuff. I recently got
multitos and found out that some of my favourite programs didn't
work so well anymore. Could anyone direct me to a anonymous ftp
site for atari stuff where I can find the newest version of the
following programs:

Rufus
Fcopy (or something simular that works under multitos)
Anyother neat stuff.
Hermes

Please reply by email cause I can't keep up with news anymore.

[lots cut for brevity:
1: upgrade existing ST.
2: buy a more powerful new Atari
3: buy a mac.
4: buy a x86 machine, and buy Gemulator, even get chance at some great new os'es.
]

>Sure, there's arguments for all 4 cases, with you obviously being a big
>supporter of #1. But your argument is only the lazy man's bandaid solution.
>A year or two when the ST market gets even deader, when more dealer shut
>down or covert to other platforms, when more ST magazines die, when more
>user groups break up, you'll be looking for a new computer anyway. So
>you'll end up going with #2, #3, or #4.

Parts of those argument #3, #4 are for systems that don't run Atari software, or that later you won't want the Atari emulation. You specificlly mention not "wasting" money on Atari products. For the clone, you mention that you can run other OSes and programs.

Maybe I'm strange. I don't like option #1 at all. I will only spend small amounts of money to upgrade a machine, and most of that on peripherals (disk, monitor, memory) that can be easily resold, or moved to the new computer.

I'd rather save my money and just upgrade to a NEW computer. Now, if I go to a clone, I see the Gemulator board in the "upgrade" category. Why would I want to spend $300 on it...when i could buy native software instead? You harp that the Atari market is "dead-end", and seem to indicate that I'll have to move totally over to the x86 (or mac) sometime. Why shouldn't I do that NOW, using the $300 I'd waste if I bought a Gemulator--if the Atari community dies like you say it will--the Gemulator is REALLY a waste of money. Hey, I can keep my ST (for 100% compatibility BTW) when I upgrade. Why should I spend more on a dead market? Hey, I'm just applying YOUR argument to it's conclusion.

I'm not saying that no one would buy a Gemulator (obviously false) or that for some, they need to run the Atari version of some software as no alternative exists. But in general, if you are going to MOVE ON, I say, MOVE ON. I would buy a Gemulator *if* I had some extra money lying around, it'd be a nice toy to play with (of course, I'd have to get the 486 FIRST).

I have the following systems forsale:

Amiga 500 cpu with
mouse
adram card (with 2.5 mb expandable to 3.5 mb)
fatter Agnus chip (for 1 mb of chip ram)
version 2.04 roms (will include ver. 1.3 if requested)
1084s RGB monitor
CLtd. SCSI Harddisk controller
Future 500 sound digitizer

Asking $450.

Atari 1040ST (1Mb of RAM)
Atari SC1224 Color Monitor (with monitor stand)
ICD SCSI Hard Disk Interface
External Quantum 80 megabyte SCSI hard disk
(in a small footprint case with fan and power supply)
Omniswitch monitor switcher

Asking $350

Amiga 3000
25Mhz 68030 Processor
5 megabytes of 32-bit RAM
(enhanced chipset provides access to 2 megabytes of chipram)
Built-in flicker fixer to display non-interlaced hi-res
Internal Seagate 44 megabyte SCSI hard disk

Asking $700

If there are any questions about the systems, feel free to e-mail me. I
will not consider splitting any of the systems up.

3335. Mint, what do I need?

Newsgroup: comp.sys.atari.st
Date: 1993-08-29 23:29:31 UTC
From: psurge@cs.utexas.edu
Message-ID: <m82eurINNrhj@bovina.cs.utexas.edu>
Source record: 201711

I have a Mega STe with 4 megs. I have wanted to try Mint for some time now, so I need to know what files I need and what I will have to do to get the system running. I would like to get version 1.08 up ASAP, but I understand if it would be easier to install an older one and move up into 1.08.

Keep in mind I have none of the GNU stuff, so I am basically starting from the ground floor on this. I have been using Gulam for some time and would like to have more of a feel of my Unix account.

Also tell me how MiNT does with GEM programs. I would IDEALLY like to run SLIP in a window in the background (which is a TOS program) and be free to run GEM programs in the foreground, maybe even multitask the GEM programs, but that is not neccessary.

Thanks

>
> Also, an STe or TT is going to have features GEMulator doesn't emulate,
> like stereo sound, MIDI, etc...

Well, for one reason, not everyone has the room for one more computer
system on their desk. I have never owned an ST of any ilk, only Atari
8bits and now a 486DX e/w 8Meg and a hard drive. I would buy the Gemulator
just to run some of the 8bit software I would like to continue to use and
some of the ST software that I would be interested in owning that is either
more expensive or not available for the MS-DOS machines. Sure it may not
have full compatability nor be able to run all the things a real ST or
Atari 8bit could run, but it sounds good enough for me.

This is already planned, I found out that the Comlynx port is just for that, its not for " I'll play my lynx version of XXX, while you play your jaguar version"

But its for 'slaving' the lynxen to the Jaguar console, such as the scenario above. So in other words, they designed it in.

3339. how do you flush midi port on st [?]

Newsgroup: comp.sys.atari.st
Date: 1993-08-30 03:25:29 UTC
From: jacob@max.cc.brandeis.edu
Message-ID: <1993Aug30.032529.10962@news.cs.brandeis.edu>
Source record: 201716
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

greetings:

i'm trying to write a few simple midi programs for my atari st
using lattice c 5.5 and i can't find any call in the libraries
that flushes the midi port (the reason i want to flush it is that
the midi port keeps incoming notes that weren't read -- even
across program exits so the first thing i hear when i start my
program is usually a few goddam notes that were kept in there
from the previous run and never read)

also i couldn't find a way to associate a file descriptor to the
midi port so that i can use fflush()

one thing i tried to do, based on information on abacus's "atari
st internals" -- the most useless book ever printed -- is to write
to the status byte of the acia controlling the midi port a byte
doing the reset (bit 0 and 1 set) but that hangs the st: i go into
supervisor mode, write the byte to acia status register and get back
to user mode. i can read that status register (in supervisor mode)
no problem though. (i _assume_ it's that register i'm reading -- i'm
using the address given in "atari st internals"...)

any idea?

please reply in email as i don't usually keep up with this group
thanks

3340. how do you set an alarm on atari st [?]

Newsgroup: comp.sys.atari.st
Date: 1993-08-30 03:35:20 UTC
From: jacob@max.cc.brandeis.edu
Message-ID: <1993Aug30.033520.11223@news.cs.brandeis.edu>
Source record: 201717
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

greetings:

i'm trying to write a few simple programs for my atari st using
lattice c 5.5 and have tried to locate alarm() or sleep() or an equivalent
routine but with no luck. the only routine that "waits a certain amount
of time" is some AES that seems to be specific to AES...

how do you time yourself on the st? for example how do you perform a task
that needs to be performed at fixed intervals? obviously you can't
intersperse your program with code checking the system clock to see if
"that time" has arrived yet. something equivalent to alarm() and SIGALARM
handlers must exit.

any help greatly appreciated...

please reply in email as i don't usually keep up with this group
thanks

jacob

tla@wolfson.demon.co.uk (Tom Laird) writes:

>I am looking for a version of Vi which works on the ST. Could
>someone please let me know where to find it.

Elvis is king. It emulates VI to a VERY high precision (in fact, it is
BETTER than VI - more options).

Available from:

atari.archive.umich.edu

in the file:

/atari/Editors/elv16beta2.zoo

Elvis has almost all the features of Unix vi (the only one I know it
doesn't have is "%" expansion in shell escapes), plus many more extensions,
including:

:prev - go to PREVIOUS file (I hate Unix vi for not having that)
v - visual highlight! You can mark blocks, etc visually.
errlist - it can parse compiler output and show error messages
in files.
(and tonnes more)

Elvis? Scrolling should be very fast if you've got a decent termcap entry.

Even under TOSWIN, it is lightning fast (with Warp9 - but you can't blame
Elvis for the speed of screen output).

I've tried MikeNET and MidiNET from atari.archive.umich.edu. Both look
good, but neither seems to work seemlessly between my TT and ST.

They allow the filesystem of each machine to be fully available from the other
(yes, you can even run programs that are stored on the remote machine, just
by double-clicking on them at the desktop).

It's not the controller? Then what is? According to the information
I've seen, each of the other chips is somewhat special-purpose. The
only other contender for the title of "main CPU" is the graphics
controller (the real 64-bit RISC chip in there), and if it's any
good for graphics, then that means that it's not especially well
designed for general-purpose processing, as the requirements for
efficient execution of graphics routines are considerably different
than those for general-purpose processing. The DSP, the only other
possible candidate, is even worse - while you can, conceivably,
use a DSP for general processing, it's going to be a superdog at
it, no matter how good a DSP it is - the design requirements are
in another space entirely.

Seems to me that what you're likely to find, in the real world, is
a dependence on the 68000 for nearly all of the general-purpose computation
in the box, for several reasons: first, there are development tools available
for the 68000 that will probably *never* be available for the RISC chip,
especially since it's Jaguar-specific. Second, it's rather dumb to tie
up the graphics chip with general computation instead of letting it
do what it's designed to do - take the heavy graphics load off of the
"main" processor. And finally, a point that nobody seems to have seen
yet - programming a RISC chip is not only a pain in the butt, but RISC
executables are always, without exception, huge. It's the nature of RISC
itself, and there's nothing you can do about it. If you're interested
in putting as much stuff into a cartridge as possible, you're going to
be using the 68000, not the RISC chip, just to keep your code size
overhead as low as possible.

3346. FREE MasterBrowse (GEnie/Compuserve/Delphi)

Newsgroup: comp.sys.atari.st
Date: 1993-08-30 07:13:40 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg._KhKcYyLlqk@elfhaven.ersys.edmonton.ab.ca>
Source record: 201531

Hello,

I have an offer to make that I hope will be of interest to GEnie, CompuServe, and Delphi users. If you would like to earn a registered version of MasterBrowse 2.8 (in exchange for uploading the public version of the program to one of the services mentioned above), then please contact me at ess@PUCnet.com immediately.

[Remember to contact me first, though. Only one person for each service will receive a registered copy of the program, so I need to know in advance.]

Upon presenting me with a file list from the service in question (by which I will know that the file was uploaded) I will send the user who uploaded the file (in electronic mail) a registered version of MasterBrowse 2.8!

Interested? Contact me. The sooner the better!

>

The best thing to do is downloading the Mint Installation Kit II at
atari.archive.umich.edu. (9files -> 9 disks)
It installs automatically in your filesystem, installing a Minix File system if you want, and you can upgrade to 1.08 later if you want (this version is 0.95
I think).
>Keep in mind I have none of the GNU stuff, so I am basically starting from the
>ground floor on this. I have been using Gulam for some time and would like
>to have more of a feel of my Unix account.
>

>but that is not neccessary.

MinT can multitask GEM programs, but the AES should handle this, too. (what does the AES version shipped with MultiTOS). The desktop should be aware of multitasking, too (use Teradesk, Neodesk). If you want to Multitask GEM progs, you should get the MultiTOS from atari, on my mind. It's easy to install and multitasks GEM out of the box.

Otherwise, Mint itself with a shell (Gulam, okami, ksh or anything) will multitask TOS apps

3348. Information required - using ST to sample sounds.

Newsgroup: comp.sys.atari.st
Date: 1993-08-30 08:15:15 UTC
From: cbrasted@physics.adelaide.edu.au
Message-ID: <25scuj$k1a@huon.itd.adelaide.edu.au>
Source record: 201729

Hi folks,

I have been reading this group for the last month, hoping to find some information about sampling with my ST, but to no avail...

What I need is a hardware attachment, so that I can take samples, through a microphone, and then use my ST to edit/store the sample, and also so that I can control the sounds with a sequencer. I have seen this piece of hardware advertised in a magazine a while ago, for about 100 pounds, but have since been unable to find another advertisement/mail order address.

As I live in Australia, which has about 3 atari retailers, none in Adelaide, I would also like to know a mail order company which sells the equipment I need.

Thanks in advance,
Charles.

Hi, are there any FTP sites that have Falcon software, PD, Shareware
etc..
If so, could I please have their addresses..

Thanks.

3350. MegaSTEs available in France

Newsgroup: comp.sys.atari.st
Date: 1993-08-30 09:37:29 UTC
From: Patrice.Lacouture@aedi.insa-lyon.fr
Message-ID: <25shop$n04@cismsun.univ-lyon1.fr>
Source record: 201723

In reply to all the people who asked whether Mega STEs are still available,
I'd like to notice that here in France brand new Mega STE 2 WITHOUT a HArd Disc
drive but with HD floppy are available for 1990 Francs at the Auchan super-
markets. They are under 1 year guarantee, plus Atari's guarantee.
Vroom and an educational program to learn English (for Kids), as well as
1st word plus are shipped with.

By error I got a 48 Meg Seagate Hard Disk in it for the same price, but THIS IS
AN ERROR that didn't happen as a friend of mine bought his one (unfortunately
I hear him saying :-).

That's all folks.

I don't earn any money from Auchan to put this posting here, they don't need
this to sell them ! It's just for your information.

Select an other font in the display dialog. This may either be a GDOS
font with any good GDOS installed or a GDOS font without GDOS installed.
In the latter case you have to install a folder named GEMSYS in the
CoNnect-Folder and put the desired GDOS fonts inside. 80x24 are no
problem using the standard CONNECT.FNT...

3359. Jaguar: is it *that* good?

Newsgroup: comp.sys.atari.st
Date: 1993-08-30 15:40:04 UTC
From: peter@stack.urc.tue.nl
Message-ID: <25t70k$9q4@tuegate.tue.nl>
Source record: 201734

Hi. A friend of mine (who also happens to own a you-know-what-computer
from you-know-what-company from West-Chester, PA - ah, cut the crap,
an Amiga) send me some official looking spec sheet from Atari Corp
about the Jaguar.

As you would probably suspect, I'm a bit more sceptical when I get
information about a new Atari product. So when I read stuff like
"64 bit architecture" (with an 68000?), "Object Processor" (sounds
just like a programmable video chip) and "55 MIPS" (just adding
27 + 27 + 1 ?!), I throw out all the marketing hype (well, that *is*
pretty impressive, to state the memory capacity in Megabits - this
is 1993, you know, people use bytes these days) and am left with
the following:

A Falcon, with some better graphics, no expandibilty to some real
computer system, an 68000 instead of an 68030 and a neat graphics
chip.

Now I've seen a Falcon the other day. The display liked really great,
as long as it didn't have to do animation and the sound was also
pretty neat. So now I'm left with this question: what does this
graphic chip really do? Atari's report on the Jaguar is useless,
it's just some wow-man-this-is-really-it-now-buy-it piece of
advertising and is utterly vague.

Is the video chip an adapted version of something existant, like the
DSP is an adapted version of the 56001? What are the *real* specs?
For instance, texture mapping, on what shapes is that possible?

One of the the 16 bit game consoles seems to have something simiral:
the specs sound great, but wait until you see it in action. It
isn't that great all of a sudden.

Please, this is no attempt to bitch at Atari in any way. I just want
some objective information on the Jaguar. BTW, I posted something
about this matter in comp.sys.amiga.advocacy, but you might not
like it.

Peter.

Darek,

Your argument is fairly lucid, so I won't bother replying to most of it.

There are several problems with it, but now that I did an f instead of F in trn I don't remember what they are! Ahahahaha! :-). I just want to point out that a "bare bones" Falcon is $799, not $1199 as you said. The $1199 Falcon is a 4/80 config. If planning on upgrading the HD and Memory as you said, that would be the wrong choice. The $799 modem is a 1/0 config.

Of course, I gather from previous messages that Atari did not put SIM slots in the Falcon, and in facct I think you need an upgrade board of some type to put in 14 MB. This is almost criminal on Atari's side. With IDE/SCSI though, the HD would be easy to top. (Prob. best to gget an external SCSI, as the internal IDE has to be 2.5" which is not cheap).

- mike

More questions...(you can tell we've been without USENET access for awhile!!!)

We are running TOS 2.5 on our MegaSTe and need to know :

1) Is there a patch or fix to allow us to play Lemmings 2?

2) Is there an update or revision of Lemmings 2 to allow operation on a MegaSTe?

3) Where can we find a list of sites with current .GIF satellite and associated weather images on the Internet to download?

Thanks a bunch - y'all are great!

3368. 'Before Dawn' 1.25 released

Newsgroup: comp.sys.atari.st
Date: 1993-08-30 18:58:00 UTC
From: Arne_Rudolph@ac.maus.de
Message-ID: <A5193@AC.maus.de>
Source record: 201861

To whom it may concern:

I've released 'Before Dawn' 1.25 today! New features since version 1.22 are:

- corrections in the "Watch... Midi" option.
- random selection of MOD-files in 'At the Movies' and 'Warp 5 - Mr. Sulu!'
- English doc's and RSC-files!!!
- some minor changes an corrections!

I will uplod it to a.a.u.e if I manage to (I've never done it before).
Otherwise you might find it on ftp.informatik.rwth-aachen.de sometime this
week! I will also upload a collection of BDI-modules.

Ciao,
Arne

3370. Why is Falcon memory so expensive?

Newsgroup: comp.sys.atari.st
Date: 1993-08-30 19:28:03 UTC
From: ajl8039@ultb.isc.rit.edu
Message-ID: <1993Aug30.192803.9373@ultb.isc.rit.edu>
Source record: 201744

I know that the Falcon can only accept memory sizes of 1, 4, and 14 megs, but can you do this with standard simms? I've heard that you need to use special memory boards. Atari advertises a base unit Falcon030 with only a 1.44 floppy and 1 meg of RAM for $800 (US$). My local dealer won't sell that configuration, but will sell me a model with three more megs of RAM for $1050, or $250 for 3 megs of RAM. Why is this so expensive? I've seen RAM go for about $30-$40 a megabyte.

3371. RDE_Version 5 (Upgrade & bugfix) sent to a.a.

Newsgroup: comp.sys.atari.st
Date: 1993-08-30 20:22:06 UTC
From: wabe@ukc.ac.uk
Message-ID: <5682@eagle.ukc.ac.uk>
Source record: 201742
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Some of you have reported that the contents of "nearly-full"
saved RDE files can get corrupted on loading.

This puzzled me quite a bit, but thanks to Wojciech Surowka who
not only detected this (rare) bug, but also diagnosed the cause and indeed
suggested the cure - which is now implemented in Version 5.

Some GUI Enhancements are also incorporated. I reproduce (below)
the "new" bit of the documentation - which explains what I've said in
more detail.

Cheers,
W. Alan B. Evans

********** Part of Documentation of RDE_V5 **********

RDE (Version_5) - Upgrade and BugFix on RDE_Version_4.
****
(Distribution to the Public Domain

by kind permission of

Mark Williams Company)

RDE Version 5 improves the GUI on previous RDE versions in that:

i/ whenever a filename is to be chosen, it now uses a fileselector
rather than the dialogue box. The advantages are obvious.

ii/ On creating a ramdisk, the _precise_ desired size in Kbytes can
now be typed in via a dialogue box. If 711 or 811 kbytes is
requested, then the ramdisk is configured as an exact image of
the 2 popular Floppy Formats (720kb and 820kb) - see RDE_V3
documentation below.

iii/ When removing a ramdisk in the GUI, you are no longer "forced" to
remove one of your installed disks (unless you hit the warmstart
button). Of course there should have been a last chance to cancel,
and now there is!

BUG FIX
~~~~~~~

There has always been an obscure bug in Mark Williams' original
RDY and in all subsequent RDE Versions. The symptoms are that if a
"nearly full" ramdisk is saved to file and then restored, then its
~~~~~~~

contents near the top end can get corrupted. Luckily this hardly ever happens in normal usage - as most people would leave empty work space in the saved ramdisk and make sure the files are contiguous (i.e. "reorganise" or "defragment") before saving. Those who have used RDE to create ramdisks that are nearly-full (usually with "read-only" utilities) might have noticed the last few files on the disk are sometimes corrupted after loading.

I am indebted to Wojciech Surowka for diagnosing the trouble and, indeed, for suggesting a cure which is now implemented. From my tests, it appears to have done the job.

Basically during loading, RDE/RDY copy the contents of the saved file to high memory below PHYSTOP where the screen is. Now if it so happens that screen interrupts (mouse movement, flashing cursor etc.) are made during the load just AFTER the last few kbytes of contents have overwritten the screen and BEFORE the ensuing warm reset, then it is clearly possible for these contents to get corrupted.

The cure is, of course, to set the system byte of the Status Register so that all interrupts are disabled during the load.

Ramdisks created with Version_5 retain full compatibility with all earlier RDE versions.

I am not aware of any remaining bug in RDE.

Documentation(s) that accompanied previous versions are appended at the end. Newcomers to RDE can find useful hints by studying them. Users are reminded that RDE only displays its full flexibility if invoked from a shell with command line arguments. RDSH (available from the archives) is a tiny, quick-loading, shell tailored for easy command line invocation of RDE.

The current executable is about 22 kbytes and is not "packed". If you desire to pack it to about 12 kbytes or so, I recommend either ICE (version 2.4) or PFXPAK, both of which produce MINT compatible executables.

It goes without saying that neither I nor Mark Williams Co. will assume any responsiblity for whatever (dire or otherwise) consequences that may arise through the use of this software.

Cheers,
W. Alan B. Evans. (August 27th 1993)

Well first remember that for $250 you are getting 4 megs of ram and throwing out 4 basically worthless 256K simms. Many of my Intel compatable friends are having the same frustration. Now $250/4meg ($62.50/meg) is not to bad, especially since memory is now going for $55/meg. Remember because of it's design, all the memory resides on a daughter board and that has a small cost to it.

Except that the Falcon doesn't use simms, as Atari claimed they
wouldn't fit. There is, amazingly, a third party board that does use
simms, and it does fit.
It has traditionally cost more to get a higher memory model ST from
Atari than the bare cost of memory, even in the case of the STe's,
though there at least, there was a reasonable alternative.

In article <25j4of$foh@cville-srv.wam.umd.edu> cmedley@wam.umd.edu (I own Bear) writes:
>And in the case of the TT or Falcon, it doesn't emulate an '030, just an
>'000 (what a moniker!) for compatibility's (and probably simplicity's :))
>sake.

Once again we have some naive idiot running around pretending to know something. Yes, he knows that a 68030 is better than a 68000. Everyone keeps telling him that. But he doesn't say why it's better because he doesn't really know. True that in the rights hands, like Apple or Amiga, the 68030 can do some amazing things compared to the 68000. In the hands of Atari, the 68030 is just used as a fast 68000. So whether you have a 16 Mhz 68000 or a 16 Mhz 68030, it doesn't really make that much difference.

Explain to me why emulating a 68030 would improve things? As was already explained to your buddy Warwick a few days ago, there is a lot of Atari ST software out there that flat out does not run on a 68020 or 68030 without having to be patched or re-written. Programs like Tempus, Magic Sac, ST Xformer, most AUTO folder programs, a lot of older programs such as those written with GFA Basic, etc. So when you buy a TT or Falcon you can kiss a good chunk of the Atari ST software base goodbye.

So what do you want? A 68030 emulator for the sake of emulating a 68030, or something that's compatible with Atari ST software? In your naive world all you know is "68030 good, 68000 bad" and I think you need to stop and rethink that.

It's bad enough that for years Atari gave minimal support to developers regarding anything about the ST, leaving it up to them to reverse engineer things and write hardware or 68000 dependent code, but then they come out with 68030 based machines and surprise, surprise, half the stuff doesn't run! The 24BIT.PRG utility helps matters in a few cases but not all. For example, it allows Tempus to go from crashing at load time to crashing at exit time.

The bottom line: you're better off with a fast 68000 than a 68030 chip as far as running Atari software goes.

Also, you would seem to imply that there is something you'd be able to do with a 68030 that you can't on a 68000? Like, is there some special version of Calamus that only runs on the 68030? A special version of Word Writer? Of anything? Hardly.

You're confusing the issue of speed with the issue of processor. Yes, a 16 Mhz 68030 is faster than an 8 Mhz 68000. Duh! Not much faster than a 16 Mhz 68000 though. Certainly a lot less compatible as far as Atari ST software goes. On a fast PC Gemulator gives you 68000 emulation at the

speed of a 68030. Speed AND compatibility. Oooh, what a concept. Pinch me
I must be dreaming.

3381. Claculating PI on an ST

Newsgroup: comp.sys.atari.st
Date: 1993-08-31 01:50:08 UTC
From: slyster@outb.wimsey.bc.ca
Message-ID: <slyster.065s@outb.wimsey.bc.ca>
Source record: 201863

I have recently tracked down the formula for caluclating PI to any number of decimals that one would wish. Indeed, it was used to calculate PI to about 29,000,000 decimal places, and there has been another try on a Cray supercomputer that has gone near 200,000,000. The study I read at the Math Library at the University of British Columbia said that it is now a matter of "one's will" to go to any number that computer free-time will allow.

I tried using ST Basic to write my own version. I got hung up on ST Basic's slow speed, and the fact that you cannot (seemingly) double-nest subroutines.

So: my question:

Is there any Assembly language programmers out there who would be willing to devote some time to write a program compatible with at least TOS 1.4, to calculate PI using Borwein & Borwein's Quadratic formula?

Contact me E-mail.

I will port over to you the formula, and the text of my ST Basic attempt.

>As you would probably suspect, I'm a bit more sceptical when I get
>information about a new Atari product. So when I read stuff like
>"64 bit architecture" (with an 68000?),

Two 64-bit RISC processors and a 64-bit data bus too. The 68000 is not the primary CPU, and only accesses the lower 16 bits of the bus.

>"55 MIPS" (just adding 27 + 27 + 1 ?!)

27.5 + 27.5, perhaps? It's a minor exaggeration, but technically correct, since the two RISC processors are operating in parallel.

>I throw out all the marketing hype (well, that *is*
>pretty impressive, to state the memory capacity in Megabits - this
>is 1993, you know, people use bytes these days)

Not in the video-gaming field they don't. B-) Go check out all the SNES and Sega Genesis cartridges in "8 megabits!", "16 megabits!", and "24 megabits!" plastered all over the packaging. When in Rome...

>and am left with the following:
>
>A Falcon, with some better graphics, no expandibilty to some real
>computer system, an 68000 instead of an 68030 and a neat graphics
>chip.
>
>Now I've seen a Falcon the other day. The display liked really great,
>as long as it didn't have to do animation and the sound was also
>pretty neat. So now I'm left with this question: what does this
>graphic chip really do? Atari's report on the Jaguar is useless,
>it's just some wow-man-this-is-really-it-now-buy-it piece of
>advertising and is utterly vague.

To quote largely from the official press release and other stuff, there's transparency, lighting, texture mapping, goroud shading, and morphing effects supported. If we assume the official stuff is not 100% imagination (Atari may exaggerate things, but they cannot out-and-out promise a feature that is not present), it's pretty impressive.

The only other real word comes from Andy Eddy, who says that his viewing of the Jaguar made it "comparable" to a 3DO, for 1/3rd the price. Given what the 3DO can do, that's no idle claim.

>Is the video chip an adapted version of something existant, like the
>DSP is an adapted version of the 56001?

Unconfirmed but widely-reported word is that the graphics chipset is a new design, by a European firm. This report comes largely from Jez San of Argonaut Software, who has no ties with Atari whatsoever and (theoretically) has no reason to make this up.

>Please, this is no attempt to bitch at Atari in any way. I just want
>some objective information on the Jaguar.

Until a EE guru hacks apart a Jaguar and dissects everything, the official word from Atari is the best we've got. Only advice is to take everything with a grain of salt and cut through the PR hype. Remember, one may exaggerate -- but one cannot flat-out lie...

3384. Tape problem

Newsgroup: comp.sys.atari.st
Date: 1993-08-31 02:19:09 UTC
From: sourada@iastate.edu
Message-ID: <sourada.746763549@vincent1.iastate.edu>
Source record: 201854
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm new to the world of tape drives, so please help me out.

Here's my hardware:
1040 STe w/4MB RAM
ICD AdSCSI+ adaptor
Quantum LPS240S (SCSI 0, no parity, etc.)
Tandberg 3600 tape drive (SCSI 1, no parity)
ICD adaptor software
TapeBIOS tape drive

(There are no problems with the adapter or hard drive, that I know of)

The tape drive will do some stuff, like retension, rewind, make noise... But when I try to run tapetest from the TapeBIOS package, it gets to the write part, makes some noise, stops, and gives me some sense data. I decoded the sense data and it says "hardware error" (sense key #4). Sounds bad.

So am I doing something wrong, or is the drive messed up?

Thanks a lot,
Steven Ourada

>your jaguar version"

To be honest, though, if the Jaguar can communicate with the Lynx via the "standard" ComLynx protocol (and it'd probably have to, in order to do what was mentioned above by Atari), there is no reason a Jaguar CAN'T be another Lynx in the chain.

Remember, the ComLynx port is just a communications medium. What gets sent over that port is controlled by software. And you can do a LOT with software.

What I'd like to see is a game released for both the Jaguar and the Lynx (say, SPACE BATTLE 3000 or whatever name you want). You can ComLynx the Lynx versions, you can ComLynx the Jaguar versions (if you can get two Jaguars in the same room, at any rate B-), you can ComLynx them together. The graphics and controls may differ, but the basic gameplay would be the same. Yowch.

And the Jaguar/Lynx/NetTrek idea sure isn't anything to scoff at...

--R.J.
B-)

P.S. And how about a Lynx adaptor for the Jaguar? Convert Lynx code to Jaguar display data, that's all. It'll be a blocky display, certainly, but if it's cheap enough, some people may go for it. Heck, the Jaguar is easily capable of doing everything the Lynx can do...

Nope; if I try to load 2 or more ACCs, GEM dies with an Address Error
and MiNT exits (with exit code 2816). :-(

Before Dawn also locks up as soon as it tries to save the screen if
there's a mouse accelarator loaded (!). This could just be my system,
but it happens with both maccel3 and SilkMouse (my favourite).

My system is pretty vanilla as far as OSs are concerned. TOS 1.04, 4M
of RAM, monochrome.

So, I grabbed Taylor UUCP today from atari.archive (well, wuarchive
actually), and swapped the Hermes 1.10 uucico for the Taylor uucico;
guess what, uucico never gets executed! uuwork tries to create
\uucico.par, which it _can't_, since \ is u:\! The error generated is
in uuwork.c (though I wasn't smart enough to write down the line
number).

Pity. I really wanted to use the minixfs for my uucp; I'll have to go
through the growing pains of converting to Taylor UUCP and finding elm
and nn ports. Ah well, I'm sure the extra speed and free-form filenames
will be worth it (hope it doesn't take me too long to weed out the
programs that don't run well with MiNT loaded).

Under tcsh at least, an "rm *" will take forever (under a TOS filesystem)
with lots of files due to the excess overheard; tcsh does a zillion
calls to the MiNT kernel to convert "*" into filenames, and then convert
those filenames into real paths. I think. :)

My /var/spool/news/control directory had about 2,000 < 1k files in it
due to someone going berserk cancelling messages (not quite an ARMM, but
hey...); it was taking longer than 10 minutes to get from typing "rm *"
to the point where rm.ttp was actually loading. I was watching top in
another window and killed the "rm *" attempt after 10 minutes or so.
The DOS filesystem dies a very slow and horrible death when you write a
lot of files into one directory.

Ew, yuck. It'd be a rather hellish mess; after all, things that we take for granted (flat memory, being able to access > 640k, etc) are either difficult or really, really arcane under DOS. Segments (yah, I like looking at those 1M image arrays in 64k chunks...) and the famous 640k limit (actually a 1088k limit these days) are death.

Try OS/2 or linux; it'll make life much easier (well, Linux sure won't, unless you know much about unix systems administration... I sure don't).

It seems evident to me that they will never release another home
computer; the Falcon is a last hurrah to allow Atari to develop for
their own console-to-be without having to support Apple or the clones.

Hiya guys,

I've got this Epson LX-80 printer I just bought of a mate of mine. He used it on His PC so I saw it working and everything. I attached it to my 1040ST , and went to eagerly print something, and nothing happens!!!! I ran Degas Elite (with the correct driver set) and I just did nothing when I came to print. I've havent got the manual for the printer, so I dont know how to set the DIP switches. If anyone out there has or Had a Epson LX-80 on there ST , can you please tell us how to set up the printer for it!! :)

Heaps of Thanx in Advance!!

Nasir ;)

>Once again we have some naive idiot running around pretending to know
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Darek, you sure know how to make a sale.

I give you a coherent set of arguments, rationally, for why your product
is maybe not quite as peachy keen as you make it out to be, and blam! I'm
an idiot.

(maybe it is just me, but why should anyone buy a product from someone
who stoops to personal attacks the moment their product is criticized?)

>something. Yes, he knows that a 68030 is better than a 68000. Everyone
>keeps telling him that. But he doesn't say why it's better because he
>doesn't really know. True that in the rights hands, like Apple or Amiga,
>the 68030 can do some amazing things compared to the 68000. In the hands
>of Atari, the 68030 is just used as a fast 68000. So whether you have a

Well is it? We all know the Falcon has a '030 attached via a 16-bit bus
to the memory. Unless we use a 3rd party board, we can't use FastRAM to
get 32-bit access via the CPU.

But in no way have I seen any benchmarks that show a Falcon running in
ST graphics modes to run the same speed as a comparable 68000.

>16 Mhz 68000 or a 16 Mhz 68030, it doesn't really make that much difference.
>
>Explain to me why emulating a 68030 would improve things? As was already
^^

Well, Darek, since YOU are such an idiot, let me lay it out for you in simple
terms.

For one thing, you are the one claiming you are offering a machine as fast
as a Falcon.

According to your own mailing, it's not.

Your GEMulator runs as fast as a 16mhz 68000 on a 50mhz 486 machine.

You're full of it if you think that we're all supposed to believe it is going to perform as well as a Falcon.

The only time it should come even close to Falcon performance when number crunching should be when the graphics chip is stealing tons of time from the CPU.

My point, Darek, if you would pay attention, which apparently is not your strong suit as you think you know it all... is that the Falcon should be able to consistently outperform what YOU claim your emulator runs like: a 16mhz 68000.

I am not suggesting in any way, shape, or form that you need to make a 68030 emulator. What I am saying is that if a user wants raw speed, they would need a high-end PC (486/50 or better) to equal a lowly Mega STe or slightly better.

My point is that if a user wants a fast Atari system, they would do better to get a TT or Falcon because GEMulator wouldn't offer the same speed increase on their current ST software as those machines would unless you ran it on a Pentium.

Have you priced Pentiums lately, Darek?

Also, if you weren't too busy turning into a major asshole, you would have noticed I advocated your GEMulator as being more flexible, and I *thought* I had offered only constructive criticism.

If you can't handle it, then that's your problem.

>explained to your buddy Warwick a few days ago, there is a lot of Atari ST
>software out there that flat out does not run on a 68020 or 68030 without
>having to be patched or re-written. Programs like Tempus, Magic Sac,
>ST Xformer, most AUTO folder programs, a lot of older programs such as
>those written with GFA Basic, etc. So when you buy a TT or Falcon you
>can kiss a good chunk of the Atari ST software base goodbye.

And when we buy a GEMulator we're giving up our money to a no-name 3rd party company that may or may not be committed to the "idiots" who buy their product, right?

>
>So what do you want? A 68030 emulator for the sake of emulating a 68030,
>or something that's compatible with Atari ST software? In your naive world
>all you know is "68030 good, 68000 bad" and I think you need to stop and
>rethink that.
>

Darek, if you even read this post this far, I hope you realize that I've been running on a 16mhz 68000 since late 1990. I've got a close friend whose system is based on the Fast Tech 25mhz 68000 system. We've both seen Falcons and TTs and our systems aren't even close in performance.

If your GEMulator, at best, does the same performance as his 25mhz 68000, and we see for a fact that a 25mhz 68000 can't match up to those machines,

how can you claim GEMulator is anything more than a painfully slow emulator
which needs an incredibly fast CPU to make it even tolerable to use?

>It's bad enough that for years Atari gave minimal support to developers
>regarding anything about the ST, leaving it up to them to reverse engineer
>things and write hardware or 68000 dependent code, but then they come out

Xpress 3.0 works on a Spectre. Have seen it working.. Dunno about 3.1

Considering the fact that he also claims to have run MS Word ($295) and
PageMaker ($579), do you *really* think he has a legal copy of XPress
($599)? Or any of the other programs he mentions? Let's not be naive.
There are some people (like myself) who purchased XPress for their Macs,
and then there are others who can't be bothered.

If that's all you want to do you could get the MiNT 0.95 binaries and
TOSWIN. They would allow you to do this with no trouble as you don't
need to compile anything. Then, you can start setting up the GNU
stuff... in about a month you should be ready to compile MiNT 1.xx ;-)

3409. GEM-View (UPDATE -> 2.46)

Newsgroup: comp.sys.atari.st
Date: 1993-08-31 10:21:26 UTC
From: fiebelko@bonny.informatik.uni-dortmund.de
Message-ID: <25v8n6$p8p@fbi-news.informatik.uni-dortmund.de>
Source record: 201878

Hi,

i have upload GEM-View version 2.46 today (Tue 8/31/93), please wait one
day before download:

o ftp.Germany.eu.net
o atari.archive.umich.edu
o ftp.uni-muenster.de
o ftp.tu-clausthal.de
o ftp.tu.berlin.de

CHANGES:

- [2.46]:
o minor changes
o better redraw after clipping
o Supports the extended ARROW-Messages (WINX 2.1)
o Bug in Online-Brighten fixed
o Bug in Scrolling fixed
o Bug in rotated PCDs fixed

- [2.45]:
o Safes desktop colors if you invert color images, too.
o Compress colormap faster.
o Bug in ZOOM fixed, SORRY!
o After clipping the size of the picture will changed in title.
o Includes SNAPSHOT.ACC, again!

- [2.44]:
o The DSP-JPEG-Decoder can switched off. Why?
o While loding JPEG images with DSP, the image can converted
to a 256 level greyscale image. (both in GLOBAL-Dialog).
o Faster transform into standard format
o Don't use the first 16 colors (desktop colors) if possible.
If you want to safe your first 16 colors allways, please
set colors to 240 in the PRESET-Dialog (^F).
Now save your new configuration with (<ALT>Z).

- [2.43]:
o changing SMALLER-gadget to the newest version of Multi-TOS
o Ignores an bug in METADOS2 (CD-ROM) in FSEEK()

Robert A. Jung (rjung@netcom.com) wrote:

| The only other real word comes from Andy Eddy, who says that his viewing of
| the Jaguar made it "comparable" to a 3DO, for 1/3rd the price. Given what the
| 3DO can do, that's no idle claim.

Please keep in mind that the 3DO has a (double speed? anyone?) CD-ROM drive
on board, just like the Amiga CD32. Opinions may differ, but I think that
the CD will become the media of the future and will replace cartridges within
a few years. They're cheap, they're impossible to copy (unless 600 Mb optical
discs would cost less than two bucks) and you can put all sorts of data
on it: audio, video and software. Let's just hope that the omission of a
standard CD drive isn't a mistake. If you were a simple customer and wanted
to buy a games console for your kids, you could choose between the CD32
and the Jaguar and you saw that games for the CD32 are half the price,
what would you buy? YOU are the one who gets to buy the software...

Peter.

Peter, I have to agree with you. Considering how things can go,
and that now we see a 68000 as the CPU I wonder too. I'll like to
see a demo of the Jaguar doing real-time surface mapping, and one
thing I would truly like to see is actual benchmark of surface mapped
objects/speed, etc.

About the 'object processor' I'll like to see how 'many sprites you can program
in it' and stuff like that.

Specs look great, but maybe there's tons of hype in it (maybe not).

No flames guys, we have to be objective here. I am one of the first
to talk about the Jaguar favorably (with an Amiga :-))

3417. MSX diskcopy on ST?

Newsgroup: comp.sys.atari.st
Date: 1993-08-31 12:23:52 UTC
From: hallvart@ifi.uio.no
Message-ID: <1993Aug31.122352.15826@ifi.uio.no>
Source record: 201883

Is there anyone who knows of (or knows how to make) a program that can copy
MSX-DOS formatted disks on the Atari ST/STE machines?
The reason for this is that I have a YAMAHA TX-16W sampler that uses this
format, and I'd like to make copies of my disks/sound files easier/faster
than using the utilities in the sampler itself.
I need a program for the ST that can;

- Format MSX DOS (720K 3.5" disks)
- Copy a whole MSX disks
- Copy individual files from/to MSX disks

Anybody?

hallvart@ifi.uio.no

|>
|>

You may not be doing anything wrong. Get a copy of the ICD's program SCSI.PRG. It will allow you to manually send commands to your SCSI tape drive, use the source from tapeBIOS to figure out the format of the commands. If this works then there is most likely 1) a timing problem or 2) an incompatability between TapeBIOS and the ICD firmware.

If the problem is an incompatability then you will need to change TapeBIOS to use the ICD hardware driver instead of it's own. I can send you some files that may help. (If you have Turbo/Pure C and Assembler)

>(Through bob brodie, who relayed the question to him)

Where can I find the delphi conference?

>The 68000 is present, its listed as "co-processor".
>Read the delphi conference. from the way it sounds, the 68000 is told
>what to do.

This makes no sense whatsoever. What is that supposed to mean? On
one level or another, *every* processor is "told what to do". Some of
them are told by their memories, some of them are told by their interrupts,
some of them are told by their internal circuitry. "told what to do"
is rather meaningless, IMHO.

The question is: which of the two (or possibly three) of the Jaguar's
co-processors (as they all are, in most senses) is going to be used
as the controlling CPU? Which one is going to be responsible for
coordinating and running the system as a whole - and thus, be the major
bottleneck for all operations? My money is on the 68000, for all the
reasons I've stated before.

3421. optimising compiler

Newsgroup: comp.sys.atari.st
Date: 1993-08-31 15:54:31 UTC
From: porbe@csv.warwick.ac.uk
Message-ID: <25vs7n$3l0@sage.csv.warwick.ac.uk>
Source record: 201890

Greetings! I am currently writing a BASIC compiler that will run on
the Atari's. It will be compile GFA and HiSoft BASIC programs. However,
compiled code will run considerably faster, several times at least (my
first benchmark tested the maths and was 12 times faster than GFA.)
Also, programs will take up less memory. I would be grateful for ANY
feedback from you folks. It would be a bit pointless my writing something
that nobody wants! It might be a good idea to include games writing stuff.
Perhaps I could sell it as an optimising compiler? If so, how much would
you be prepared to pay for it? What improvements would you like to see?
Sorry about this blatant market research, but I'm a desperate man!

Best Wishes,
Mark.

P.S Programming I can just about handle,
but all this sales and marketing
stuff turns my brain to lime jelly!

>they want? Wayne

Well, I have to score one for Atari here... never had anyone there call me
an idiot publicly if I criticized one of their products.

Actually, Darek never addressed some of my other potential criticisms to
GEMulator, namely:

- lack of MIDI support
(i think i've made a case that MIDI users spend as much $$$ on their
software as the DTP users he aimed for with GEMulator)

- no guarantee that the product will be upgraded
(this WAS a trivial concern initially, but now... if he is so fickle, how
can anyone be sure he won't just have PMS and drop the product next
week because he feels irritated?)

- the fact that GEMulator requires a 50mhz 486 to run 2X the speed of a
stock ST makes it obvious (to me, at least) that a power-user who wants
a "faster ST" for things like, say, the GNU compilers or anything of that
ilk, might be better off with a TT (which can run 3-6 times faster than
an ST) or even a Falcon. And either way, they also get "bonus" hardware
(like stereo sound, localtalk ports, > 8MB limit, newer TOS version(s),
the 56001 DSP (Falcon), et. al.) which GEMulator doesn't emulate.

However, even if Darek has been a bit of a net-jerk, I have to say I think
GEMulator is a nice job of programming (sounds like it must have been hell

to do), but I just think both the product (and perhaps its author? :)) need to mature a bit in order to appeal to a wider base of users.

3423. MiNT OK, now CS-TeX -> problem

Newsgroup: comp.sys.atari.st
Date: 1993-08-31 16:26:32 UTC
From: d70@nikhef.nl
Message-ID: <2416@nikhefh.nikhef.nl>
Source record: 201894

I managed to install MiNT on my 3 MB 1040 STf + Mf 30, and now I want
a newer TeX than I had before, so I got CS-TeX 4.0, and tried the
install.prg which comes with it, but I can't say it works very well:
it askes whether I want to abort it over-and-over-again.

I don't think I'm supposed to click 'NO' buttons all evening to have
this stuff installed, so what should I do? Install it manually? Is
it obvious where to put it then (/tex I assume)?
Will I run into more problems then?

3424. Mint Question (1.08)

Newsgroup: comp.sys.atari.st
Date: 1993-08-31 16:32:45 UTC
From: mcookson@flute.calpoly.edu
Message-ID: <1993Aug31.163245.156594@zeus.calpoly.edu>
Source record: 201892

I compiled Mint 1.08 about two weeks ago. I was advised to name it "MINTNP.PRG" instead of "MINT.PRG".

I have not done this, because I don't see why. According to the docs with mint, if you call it mintnp, it does not load the MultiTos Kernal. Why on earth would I want to do that?

I will go try it once. But someone who knows please explain. Is Mint 1.08 equivalent to MultiTos? It is now copyrighted by Atari (it says MultiTos kernal (c) Atari 1993). If you rename it "mintnp" does the kernal not load?

It seems to imply that if you dont have the MultiTos kernal, call it mintnp. But this also does not make sense to me. It seems to BE the MultiTos kernal (or at least include it).

Please reply in email. I will post the result, as I assume at least one other person in the world is confused about this.

Thank you,

Mike

NOPE!

The falcon has a single TOS rom that is 16bits wide, as the CPU bus
between the CPU and anything else in the Falcon is 16 bits wide. Trust
me, I've seen the schematic and it is definately only 16 bits wide....
althought the video memory is 32 bits wide..

>to buy a games console for your kids, you could choose between the CD32
>and the Jaguar and you saw that games for the CD32 are half the price,
>what would you buy? YOU are the one who gets to buy the software...

Please also keep in mind that you don't have to buy the CD-ROM up front, but
later when you can afford it. Or never, since the cartridges can hold about
50MB of compressed data. And that parents might not like their young kids
scratching the hell out of CD's. Cartridges do not have to be handled with
care.

Personally, I'd rather have a cartridge + optional CD system than a CD-only
system.

Tom

P.S. I guarantee that 3DO games will NEVER be half the price of Jaguar
cartridge games. No way.

3430. S.F. Chronicle on Atari

Newsgroup: comp.sys.atari.st
Date: 1993-08-31 18:11:32 UTC
From: L676791@LMSC5.IS.LMSC.LOCKHEED.COM
Message-ID: <93243.40292.L676791@LMSC5.IS.LMSC.LOCKHEED.COM>
Source record: 201897

The following article appeared in the "Technology" column of the August 31, '93 San Francisco Chronicle business section, page C-3, written by Ken Siegmann and Don Clark:

"Atari Corp., the once soaring, now sagging, computer and video game company, is in the unenviable position of trying to launch a major new product while its sales are falling so rapidly that they could disappear altogether.

Two weeks ago, Atari introduced its spiffy, new Jaguar video game system that will compete with systems from Nintendo, Sega, and upstart 3DO. The Jaguar can be hooked to a television set to play three-dimensional video games with high-fidelity stereo sound.

But a week after Atari wowed us with its glitzy video game demonstration, it wowed us again with the collapsing state of its finances.

Atari announced that its sales slumped to $5.7 million in its second quarter that endedJune 30, compared with sales of $23.3 million in the same quarter of 1992. The company lost $6.6 million this quarter, an improvement from the $39.7 million loss it posted in the second quarter last year. Atari has lost money in six of the last seven quarters and its sales have been falling for years.

The company noted that it has $35 million in cash - money it has hoarded to launch an aggressive advertising and marketing capaign for Jaguar. If it's not more successful than the company's other products, Jaguar could leave Atari out of gas."

(grin)

Understandable enthusiasm, my friend (I have SPECTRE as well), but what you saw was an article stating that Quark Xpress 3.0 works with SPECTRE, and the author was uncertain about the functionality Quark Xpress 3.1 under SPECTRE. Hope this clears any potential for the rumor mill Xpress...

>>>>>>>>>>>>>>>>>>>>>>>>>>>I don't want this stupid message anymore.
>

Just a thought, but I don't see the SOZOBON\BIN\, SOZOBON\INCLUDE or
SOZOBON\LIB\ directories on your BOOT DISK. When I installed Heat & Serve

C v1.4, I made my boot disk the program disk so it has all the sub-dirs & prgs available when the paths are defined. It doesn't seem likely, but TOS may be checking for the existence of the sub-dirs & prgs when the variables are being defined during boot. If the sub-dirs aren't on the boot disk they aren't defined properly and can't be found.

If they are on your boot disk, I wonder if their physical address is being kept for reference later on. If so, then the address TOS or your shell has is no longer valid when the second disk goes in.

ps I'm using a single drive STe w/o a hard drive and I haven't had a problem with Ian Lepore's Heat & Serve version of SOZOBON C. Mind you I don't get to play with it a lot. BAD :)

Hope this helps :)

>Sorry about this blatant market research, but I'm a desperate man!

> Best Wishes,
Well well! That looks like an impressive project you're on! But mind
that there already is a GfA-compiler; don't know about the HiSoft.
The only way you could have succes IMHO is when your code is faster
and, more important, cleaner than the GfA one. GfA BASIC allows for
some pretty nice programming (I DON'T want to restart the "You should
learn C, BASIC is for kids"-flame!) but the code is dirty and won't
run on graphic cards for instance. If you can do better (and cheaper,
if you can) I'm sure lots of people would be interested. But rumors
tell that GfA is working on a version 4.0, which should be Falcon
compatible and (at last!) neatle conforms to GEM. So you might want to
wait for that version until you spend so much time on your project.

However, if you're almost finished already, we'd love to see it in PD
or shareware :)

3437. PI Calc prg for the ST

Newsgroup: comp.sys.atari.st
Date: 1993-08-31 21:25:44 UTC
From: slyster@outb.wimsey.bc.ca
Message-ID: <slyster.06at@outb.wimsey.bc.ca>
Source record: 201775

I have had three bites from people willing (anonymously!) to take a crack at writing a PI Calculating program for the Atari ST/TT/Falcon030.

The following is a LONG message sent to them with the details. Any other takers?

THANKS for agreeing to take a crack at writing a program that will calculate PI (to a user-inputted number of decimal digits to the right of the decimal place). This program is to run on the Atari ST/TT/ and/or Falcon030, with a minimum of TOS 1.4.

If you get this to work, my address is:

STUART LYSTER
13800 Blackburn Avenue,
White Rock, BC CANADA V4B 2Y8

I will reimburse postage!

My inquiry into a formula for calculating PI was piqued by the Scientific American article in 1988 by Borwein, about, "Ramanajun & PI." Borwein is one of two Canadian brothers (Math Dep't at Dalhousie University, Halifax, Nova Scotia) who together supplied the Quartically Convergent Algorithm that allowed David Bailey (of the Nasa AMES Research Centre) to calculate PI to 29,360,000 decimal places in January of 1986.

It is one thing to come up with an algorithm that will converge quickly on PI. It is quite another to run that algorithm efficiently on a computer - even the Cray supercomputer Bailey used. There are a few arithmetic problems to solve in one's program, before actually running the thing.

Basically, the following is the 1984 algorithm by Borwein & Borwein:

Let a(0)=the square root of 2
Let b(0)=0
Let p(0)= 2 + the square root of 2

Then iterate the following formulae:

```
a(n+1) = (square root (a(n)) + ( 1 / square root (a(n)))
-------------------------------------------
2

b(n+1) = square root (a(n)) * ( 1 + b(n))
-----------------------------
a(n) + b(n)
```

```
p(n+1) = p(n) * b(n) * ( 1 + a(n+1))
-------------------------
1 + b(n+1)
```

p(n) converges quartically to PI, successive iterations of this
algorithm yield 3, 8, 19, 41, 83, 170, 345, 694, 1392, 2788....
correct digits. This algorithm is NOT self-correcting, EACH of the
ten iterations (to produce 2788 'correct' digits) must be performed
with more than 2788 digits of precision.

More recently, Borwein & Borwein found another quartically converging
(and better) algorithm. This finds 1 / PI:

```
a(0) = 6 - (4 * square root (2))
y(0) = (square root (2)) - 1

y(n+1) = 1 - (fourth root ( 1 - y^4))
-------------------------
1 + (fourth root ( 1 - y^4))

a(n+1) = a(n)*( 1 + y(n+1))^4 - 2^(2n+3) * y(n+1) * (1 + y(n+1) + y(n+1)^2)
```

A(n) converges to 1/PI.

To facilitate finding squares (and fourth roots!) and to find
inverses, the programmer makes use of Newton's techniques to reduce
both to simple multiplication:

```
x(n+1) = 2*x(n) - A*(x(n)^2) converges to the reciprocal of A

y(n+1) = 3*y(n) - A*(y(n)^3)
----------------
2 converges to the reciprocal of the
square root of A
```

Bailey uses 'Multi-precision Multiplication' to keep track of the
results of a large digit multiplication. put every digit into a cell
of an array, and then....

```
z(0) = x(0)*y(0)
z(1) = x(1)*y(0) + x(0)*y(1)
z(2) = x(2)*y(0) + x(1)*y(1) + x(0)*y(2)

(....... alll the way to .............)

z(n-2) = x(n/2 - 1) * y(n/2 - 1)
z(n-1) = 0
```

Then you release the 'carries', so that if z(m)>9,

```
then z(m-1) = z(m-1) + INT(z(m)/10)
z(m) = z(m) - 10*INT(z(m)/10)
```

These are the best algorithms. They converge the fastest on to PI.
But me, being the chicken that I am, tried (in ST Basic) to use
Manchin's 'arctan' formula(s)

```
PI = 16 * (arctan(1/5)) - 4 * (arctan(1/239))

or a three step calculation....

PI = 24 * (arctan(1/8)) + 8 * (arctan(1/57)) + 4 * (arctan(1/239))

Since an arctan calculation can be reduced to the recursive formula:

arctan(x) = x - x^3 + x^5 - x^7
--- --- --- ..............
3 5 7

It should be easy to compute Manchin's two-step or three step
formula.

In any event, the following is my attempt to use ST Basic. Pick it
apart - it may give you some hints as to how to proceed. I find ST
Basic to inadequate for the task - and really do want a program that
will have a nice looking screen printout... or a printer printout.

It really depends on the designer. The Z80 processor was utilized as a
main CPU on some 8-bit computers, but it is designed (in the Genesis/NeoGeo) as
a coprocessor to work with a more powerful Motorola 68000 16/32-bit CPU. You
CAN use a 68000 as a coprocessor (ie. I/O controller, GenesisCD's 68000). My
guess is that it would be cheaper for Atari to use a 68000 as a general I/O
controller 'cause Atari has been a Motorola customer since 1985 :)

Actually, in home consoles, Megabits has been the common unit for a
long time. Atari has no choice but to use the lingo of the trade,
lest they lose customers who think that 2 Megabytes is less than
8 Megabits.

> - Copy a whole MSX disks
> - Copy individual files from/to MSX disks

Is the X in MSX-DOS a placeholder (i.e. MSDOS 3.1, MSDOS 5, etc.) or some other type of format? Either way, if it is even close to MSDOS or Atari formats (1-83 tracks, < 11 sectors per track) you should be able to copy them with Magic Shadow Archiver, ProCopy, Acopy, and probably even F-Copy 3. All of these programs have the ability to copy disks at a fairly low level. MSA would probably be all you need, though. It creates a file containing all data and formatting information from a disk. It can also generate a disk from such a file.

MSA and Fcopy3 are available from atari.archive.umich.edu. Fcopy3 is shareware. Procopy and Acopy are commercial backup programs (capable of copying some copy-protected software, hence the ability to recreate funny disk formats).

Unless the format is particularly MSDOS or Atari compatible, you will probably have troubles managing individual files on the disks with the ST. You may want to see if someone has written a dedicated program for this (perhaps on Compuserve or Genie). Entire disks should not be a problem unless they are some sort of bizzare quad density (or similar).

Well, I dunno... you must not forget that the thing is going
to be a game machine, and to be honest, you dont really need much
computing power in a game machine.
I dont know the first thing about video game technology, outside
of the obvious, but most of it seems to be 'special' processors, with
very little use or need for a general purpose processor. The 68000 is
probably doing the same function that a Z-80 at 2MHz is doing in your
microwave oven: just a simple embedded controller... (which I know
a little about).

Also, dont forget who built the thing: Atari. Sure the company
is falling apart like crazy, but these are the same guys who gave you
such wonders as tbe 2600, and all those great arcade games... They
may not know computers :-) but they do know games... (altho, for some
reason, I seem to recall seeing that the game department of Atari
was seperated from the computer department?)...

I have bought a falcon030, I am a bit happy, just a bit.
Its nice and cool, but my config 4meg -80meg, seems insufficient for
multitasking. It multitask, but I get an average of 3 alerts a day cos
the drivers,sam and the acc's leave me with about 600K out of the four megs.
Anyway here are my questions,

1) How much is the 14meg ram board ?

2) Are there emulators or accelerators (please be very specific) ?

3) Where can I get the commercial d2d, and can it create a loop ?

4) Can I use an slm printer on the Falcon ?

5) Is there any CD software for the Falcon ?

6) What drivers do I need to hook up an NEc cd rom drive ?

7) How do I view photo CD applications on my falcon ?

8) Is cubase audio available for the Falcon ?

9) Is the Falcon a successful product ?

10) What else is the dsp being used for in the Falcon ?

11) Whatever happened to those NeXT developers who were going to do stuff on
the Falcon ?

12) What Graphic cards exist for the Falcon ?

13) Any Street fighter II or world heroes clone for the Falcon ????

gotta go

Sure. Here's the press release. But remember, nobody has PROMISED that a
Jaguar will be shown -- only that (between it being Atari's hot-ticket item
of the year, and the tooling up of units by IBM, and the lack of secrecy
remaining on the machine now) it MIGHT show up.

-------------------------------------+-----------------------------Lynx up!
"You weren't chosen because you are the best pilot in the Air Force. You were
chosen because you are the class clown and frankly, you're expendable."

The Glendale Show, Version 7.0, The Legend Continues.

The show will be held Saturday and Sunday, September 18-19, 1993 at
the Glendale Civic Auditorium, 1041 N. Verdugo Road, Glendale, CA.
Hours are 10:00 am to 6:00 pm on Saturday and 10:00 am to 4:00 pm on
Sunday.

General Admission is $5.00 per person. If you plan on attending and
you live outside of Southern California you may get FREE admission by
sending a self-address-stamped-#10 envelope (the long one) to
H.A.C.K.S., 249 N. Brand Bl. #321, Glendale, CA 91203 and get two one
day passes.

For those of you who will be needing lodging we have made arrangements
with the New Red Lion Hotel in Glendale. Regular rates are $129.00
per night but if you mention ATARI/HACKS you will get a room for
$79.00 per night, single or double occupancy. Reservations may be
made by calling the Red Lion at 818-956-5466. The hotel has a free
shuttle from the Burbank Airport. The guaranteed reservation cut-off
date is August 28th. If you are quoted another rate ask for Janet
Waldie in Sales.

Atari will be doing something very special in conjunction with this
year's show. Look for more details soon.

Look for our full-page advertisement in upcoming issues of AtariUser magazine. If you have any questions send mail to H.A.C.K.S., 249 N. Brand Bl. #321, Glendale, CA 91203 or leave GEmail to John.King.T or call John King Tarpinian at 818-246-7276.

3446. PC Ditto/Hard Disk

Newsgroup: comp.sys.atari.st
Date: 1993-09-01 02:21:47 UTC
From: ak354@cleveland.Freenet.Edu
Message-ID: <2610vr$bd9@usenet.INS.CWRU.Edu>
Source record: 201765

PC Ditto Hard Disk Access

I'm running PC Ditto 3.01 on a 4 Meg Atari 1040 STe with TOS 2.06 and a monochrome monitor. I am using version 6.0.7 of the ICD booter with an AdSCSI+ host adapter and a Quantum 240LPS drive. The drive is SCSI ID 0, LUN 0. Both read and write caching are disabled.

I have not been able to access the hard disk partitions from the PC Ditto emulator. I have the hard disk option selected in the PC Ditto menu. When I request a directory of the C: drive, I get a list of numbers with dates which look like file names, but aren't. The drive free space appears to be approximately correct. The C: partition is about 5 Meg.

I get similar results using the PC_DHD.SYS driver and trying to access the other partitions. Except for C: they are 32 Meg GEM partitions.

I'd appreciate any advice on where to look to resolve this problem.

So much for Falcon sales.

Peter

Unfortunately, the "Atari that knows games" is not THIS Atari...

The Atari that gave us the 2600 was Atari, Inc., owned by Warner Brothers.

The Atari that gives us all those wonderful arcade coin-ops is Atari Games,
a totally separate company.

Atari Corp. is the one that gives us all these wonderful press releases...
and little more...

BobR

I probably should have kept this to private reply but... Anyways, I don't know much about the program, "That's Write 2" However if you are thinking about upgrading WordWriter ST, I would highly recommend AtariWorks. It is a really great program. The thesaurus alone is worth it, but everything is great.

Speaking of WordWriter ST, I bought a copy a while ago (before I found out about AtariWorks) and I noticed recently that there is a thesaurus, but no way to access it? The manual didn't mention it, the help files don't, the little buttons on the bottom don't mention it either. This is v. 1.0, does anyone have a clue on this? If so, I would appreciate your sharing it with me. <g>

] Unfortunately it's a bug, but it will be fixed next week...

Another possible bug is this (It may just be a changed option),

If I extract some files with:

(e.g.)

c:\temp\file.lzh

and that's it, running Lharc from say c:\ instead of the program
extracting to c:\ it extracts it to the source directory! It used
to extract to wherever Lharc was booted from!
(No, I'm not using any redirection with either version, just plain
GEM/TOS 1.02! (Yes, I know, 1.02 is horrible.... With luck.....)

Bug, or change?

Well, there are programs out there which make use of the PMMU, notably
MultiTOS and virtual memory managers like Outside and VRAM. But I would
agree that this isn't an issue for Gemulator customers.

I can only think of three problems with the CPU type. One of them is the
fact that all 32 bits of a pointer are used, so applications using the upper
8 bits for private stuff crash. But that was a well known fact years before
the TT came (and, in fact, it was a much greater problem for the Mac
developers, it seems).

Another problem is the size of the stack frames for programs that
hook into exceptions (mostly AUTO folder programs). This was resolved
half a year before the TT came out by documenting the system variable
_longframe.

Then, there's the problem of self modifying code. Again something which
was known long before.

I don't think that it is Atari's fault if there's still software which doesn't
work right on a 68030.

Was there ever a Kaos-Desk released later than version 2.01? (English!)
I know everyone will tell me to use Teradesk/Gemini, but neither of
these are much use to a poor person like me with a mere 1meg of RAM,
as Kaos-Desk has the 'resident' option, which makes life much easier!

Anyone?

Source record: 201774
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi all.
I got a problem with Pure C:
I set the env variable SHELL=c:\bin\sh.ttp at bootup with GEMENV.
When I run Pure C, asking from menu "TOS shell" it tries to load
something but returns immediately to Pure C.
If I call Pure C from sh, it works.
My shell is Okami (latest version).

Another problem : I got a clipboard folder C:\CLIPBRD
that all my programs use correctly... BUT everest !
When I activate the GEM clipboard (GEM-Klemmbrett an) and I try to use it,
Everest tells me that there is no clipboard path.
In the env var I tries to put CLIPBRD=C:\CLIPBRD
and CLIPDIR=C:\CLIPBRD
but no avail !\

Has anyone a text or anything that explains the principal ENV-VARS to know ?

And what their value should be (path/prefix, etc...)

Thanx A lot !

Patrice

Hello Spencer,

I have the same problems with the driver of the Reflex-Graphic-Card and the NVDI 2.5. For me, it seems to be a problem with the new internal switch off of the NVDI-GDOS when booting REFDRIVE 2.0 after NVDI. With NVDI 2.11, I am using again after updating to 2.5 and testing it, the driver works under TOS 1.04 but with MTOS 1.01 (even without NVDI) the driver has REDRAW-problems 16 bits(pixels) at the right and left border at resolutions above 1024*492. Below that res the problem rises only on the right site of the screen.

The german distributor of the Reflex-Graphic-Card told me, that I was the first user who has reported such problems and the author of the driver don't want to fix this problems, because the board isn't sold any more for a year now.
Nevertheless if somebody else want to phone him and help me to convince him to do this Fixes of the driver - I have the phone number :-).

Latest news is that the Atari Messe will not be in Duesseldorf next
year. It is currently investigated if the messe can be held somewhere in
the Ruhr area, which would make it more accessible to Dutch Atari users
too.

>wait for that version until you spend so much time on your project.

Wasn't there a post recently that announced, GfA has stopped support for
Atari? Or was it the ST only?
Well, Mark, in any case you might run into trouble. After all, GfA-basic is
copyrighted, and I suppose this includes not only the code, but also the
syntax and elements of the language. So the distribution of a GfA-compiler
might interfere with GfA's copyright.

On the other hand, if you've almost finished and are fully compatible, why
don't you give the folks at GfA a call and ask whether they'd like to market
and sell your compiler? The existing one isn't so impressive, after all, and
with your benchmarks you should do a _lot_ better than their compiler. If I
remember correctly.

But here's the problem: If GfA has lost interest in the Atari-market, they
won't distribute your compiler. On the other hand this doesn't mean
necessarily, that it is legal for you to sell it on your own account.

>However, if you're almost finished already, we'd love to see it in PD
>or shareware :)

Definitely.

>> Mark.

>Sander SToks
>sanders@sci.kun.nl

>>P.S Programming I can just about handle,
>> but all this sales and marketing
>> stuff turns my brain to lime jelly!

The story of my life, too. I have a few programs at home that could be distributed as shareware at least, if I only could summon power and will enough to clean the code, kick out the bugs and write a decent documentation...

Perhaps there is anybody out there who is willing to organise something like a Netters Association of Shareware Authors (tm)- gives a nice acronym, doesn't it...?

Well, Mark, keep us up do date, okay? I'd love to hear more about your compiler!!

Greetings, Elmar

Atari 520 STE Complete Home Computer Package

Atari 520 STE 2.5MB RAM, D/S Internal disk drive. Supplied boxed in Turbo package which contains mouse, joystick, 8 games and productivity software (paint, music, basic, stos)

Barco Colour Monitor

D/S External disk drive

Star STX80 Printer, boxed with 2 paper rolls

Lots of quality entertainment s/w (boxed with manuals) including;

Lemmings James Pond 2 - Robocod Blues Brothers
The Immortal Space Crusade Cruise for a Corpse
Microprose Golf Speedball 2 Shadow of the Beast
Gauntlet II Viking Child North and South
+ more

Konix Navigator/Logic Stingray Joysticks (boxed)

Atari ST User Magazines (approx 2 years) with coverdisks. These include heaps more games/productivity s/w including Hisoft C Interpreter, Hisoft Harlekin, DEVpac assembler, STOS 3D, spreadsheet and word processors.

Computor Cover/Mouse mat/All Leads/Instruction books supplied.

This is a capable home computer with good graphics and stereo sound capabilities. All equipment is in vgc and mostly boxed suitable as a gift. Any inspection invited.

A bargain at ?300 for the complete package (UK Only)

Yes, sure, *some* work is being done.
I'm currently hacking at the SCSI driver (TT only, as I have no Falcon and no Falcon docs, donation of either of these or both are welcome!).
One guy should be working at the console driver, and our coordinator (Arjan Knor) should be doing some kernel hacking.

For more info, mail to arjan@usn.nl (Arjan Knor), or subscribe to the LINUX 680X0 mailing list at linux-activists-request@niksula.hut.fi (I hope this is correct!)

Greetings, Joe

>16 Mhz 68000 or a 16 Mhz 68030, it doesn't really make that much difference.

Depends on the software. The 68030 has fixes in the older instruction set that makes it more efficient (such as true 32-bit multiply and divide). I do not know if the software vendors are doing this, but recompiling their software on a compiler that utilizes the full instruction set of the 68030, will get notible speed differences to a 68000 based counterpart running at the same speed.

>
>Explain to me why emulating a 68030 would improve things? As was already
>explained to your buddy Warwick a few days ago, there is a lot of Atari ST

>can kiss a good chunk of the Atari ST software base goodbye.

On a marketing view, Darek has a valid point. Software drives the market and if most of the Atari software will run on an ST, than why build compatibility for the TT/Falcon market. The TT/Falcon market is not as big as the ST market (more ST's out there than TT's or Falcon's). Plus, emulating a 68030 processor on a 68000 based CPU can be tough. 68000 does not support virtual memory management. instruction restart, communications to other coprocessors (like a floating point co), and a few other things. Emulation could probably be done with some fancy programming and with the aid of a 386/486 based cpu (since it supports similiar functionality as a 68030/40), but I think it would be too damn slow. Use a 68030, or later, chip if you want 68030 ability.

>It's bad enough that for years Atari gave minimal support to developers
>regarding anything about the ST, leaving it up to them to reverse engineer
>things and write hardware or 68000 dependent code, but then they come out
>with 68030 based machines and surprise, surprise, half the stuff doesn't run!
>The 24BIT.PRG utility helps matters in a few cases but not all. For example,

>it allows Tempus to go from crashing at load time to crashing at exit time.

I think Atari and some software developers are both to blame here,
IMHO. The 680x0 family has compatible instruction sets (the later cpus
just have added instructions). Motorola designed the chips in this way
so software backward compatiblity would exist. I think OS changes on
Atari's part, and unrecommended programming practices have given
software compatibility a problem.

>
>The bottom line: you're better off with a fast 68000 than a 68030 chip as
>far as running Atari software goes.

Probably true (for now).

>
>Also, you would seem to imply that there is something you'd be able to do
>with a 68030 that you can't on a 68000? Like, is there some special version
>of Calamus that only runs on the 68030? A special version of Word Writer?
>Of anything? Hardly.

There IS something you'd be able to do with a 68030 that you can't on a
68000. However, software vendors and OS developers take advantage of a
68030 is another story.

I would just like to state that I am a statisfied Atari owner. I have
a 4+ year old MegaST2 and it does what I need for home use. For a
person who has used multiple platforms, Atari has the best PD software
and some of the best commercial software (even though there is not as
much software out there as in the PC market). You cannot beat Calamus
or Pagestream for DTP. These packages have been doing stuff for years
that PC/Mac based apps are just starting to do. I'm not a musician,
but there is some outstanding musical based software also.

My only grievance about a Atari is the lousy job of marketing and
the lack of effort to keep up with technology. I still wonder
why Atari did not go with a 30+Mhz 68030 cpu. The price difference
from a 16Mhz cpu is not that great.

Also, I have greater grievences about the PC/Mac market. Macs are
still too expensive and the choices of OS's on PC's is not too good.
OS/2 is a valiant effort, but still needs some work. MS-DOS is
outdated. Windows NT is a big hog. I saw NT running on a 486DX2/66
w 8MB of RAM. I was not seeing 486DX2/66 speed, I was seeing 12ms
hard drive speed (way too much swapping).

One more thing, I expect better ettiquete from someone from MicroSoft.

No! Not NetTrek... Netrek! Big difference. The former is a barely-playable Macintosh game with few tactics and even less strategy; the latter is a highly-addictive up-to-16 player game running on Xterms/workstations (I'm surprised at you, Rob... you went to USC, where some of the most rabid Netrek players reside...)

The reason the Lynx/Jag combination would be ultra-cool is that Netrek (not NetTrek) is a client/server game. So even the programming paradigm could be retained...

Source record: 201797
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

You miss the whole point Ted. My list of options below is for people who need a more powerful machine. i.e. you buy Calamus SL and find out your 1040ST doesn't quite have the requirements to run it. So you need a more powerful maching capable of running ST software. For as long as there is Atari software around (regardless of whether Atari is still around or not) there will be a demand for computers capable of running that software.

Yes, the Atari line is a dead end. I've been telling people that for years!!!! Buying any Atari hardware is a waste of money period. I don't deny that that's been my opinion of Atari for most of the last 5 years. So you haven't made any amazing discovery by realizing that yourself. But that's not what the point of the discussion below is about. Gemulator is NOT about getting PC users to suddendly start using Atari software. It's about offering an alternative to Atari hardware that still allows you to run your Atari software and not have to purchase a dead end computer. I don't know about you, but over the 6 years I've owned an ST I've built up a software library of several dozen programs, worth costing well over $2000. I'm sure the same is true of most Atari users, especially ones who use it to run applications. Unless you're a pirate, $200 is a small price to pay to maintain compatibility with hundreds or thousands of dollars worth of software.

Also, Gemulator is a $229 product, complete with ROMs. That's the list price. Street price at most dealers who carry it is $199. Perhaps you need to brush up on your math (you are probably American born and educated, which would explain a lot) because $229 DOES NOT round up to $300.

Now if you want to purchase a 486 and sell off all your ST hardware and software, that's entirely your choice. It's something I've advocated for years. But like you said, if you had the money. Do you have the money to replace that Atari software with equivalent PC software and do it for under $200? I doubt it. That's why Gemulator is a nice $200 solution to that problem. Buy the PC and Gemulator. Then over time buy more and more PC software. Since there are a lot of Atari users in this predicament (i.e. they don't all have thousands of dollars lying around to buy tons of PC software), a market for Gemulator exists. People will buy it unless everyone suddenly wins the lottery. <grin>

>the CD will become the media of the future and will replace cartridges within
>a few years. They're cheap,...
>... that games for the CD32 are half the price,

Ridiculous. Raw materials is not the deciding factor in game prices. What
percentage of $50 do you think is the plastic case and the ROM chip? If
you can make a CD for $2 and a ROM chip for $10 doesn't mean you sell CDROM
at five times or twice or even $8 less than ROM.

Besides, you can't run programs off a CDROM. They have to go into RAM
first. The Jag has a 14Mbyte ROM, 2Mbyte RAM. Would you want valuable
RAM taken up by read-only code and run-time data copied off a CDROM or
taken up by 720x576 32 bit colour graphics?

No, you're wrong and developers already know why. See my other post.

>Besides, you can't run programs off a CDROM. They have to go into RAM
>first. The Jag has a 14Mbyte ROM, 2Mbyte RAM. Would you want valuable

>taken up by 720x576 32 bit colour graphics?

You can't "run" programs from either a CD-ROM or a cart; the actual
control logic needs to be in RAM for either system. As far as keeping
your ROM data on a CD vs. a chip, the double-speed CD-ROM drive makes
this question virtually moot. For 95% of the ROM access in your average
game, 300Kb/sec is fast enough. So you're trading 5% of slower ROM
reads against many megs of cheap memory.

If you've just bought SL, SELL it (or return it) and buy a native app for
your new PC. I think you'll even SAVE money. This only works if you don't
NEED SL anymore...which you won't if you've JUST bought it. I think
someone would be really silly to buy SL for an 1040ST, but there are some
who'd try it.

>Yes, the Atari line is a dead end. I've been telling people that for years!!!!

>a pirate, $200 is a small price to pay to maintain compatibility with
>hundreds or thousands of dollars worth of software.

Does ALL of that software need emulated? How well does UIS III intergrate
with Windows? Is Stalker that much better than Procomm for Windows (which
I can get FREE)? Games don't count either. Hmmm....I could run EdHak!
I don't know if you did this (factor in utility programs that won't be
needed if you go cold turkey).

Part of the argument is, I can always keep my old ST and run the programs
on IT. The program that I need to have more speed, I can replace with a
native version. Is Calumus SL really so good that a native Quark/Ventura/
Pagemaker aren't any better? And if you REALLY use SL, you can afford
either to move to a native version OR risk the paltry sum of a TT. Besides,
does it really run faster than a TT? Even SL won't be much of a case for
longer....aren't they porting it to NT?

Of course the problem with this is you have TWO machines....
it takes up lots of space (my room relfects this).

Unfortunatly, Gemulator doesn't seem to fit in my cube properly so I'm stuck. <g>

Any chance Gemulator will work under NeXTSTEP for Intel? Running Soft PC? Does it work under OS/2? NT? Alpha NT? MIPS NT? I know the market is small...but I'm just curious as IF I make the jump, I'll probably NOT be running Windows/DOS. Of course...that Power PC is looking nice..... (I'm starting saving now for the computer that I'll buy next year sometime.)

>Also, Gemulator is a $229 product, complete with ROMs. That's the list price.
>Street price at most dealers who carry it is $199. Perhaps you need to
>brush up on your math (you are probably American born and educated, which
>would explain a lot) because $229 DOES NOT round up to $300.

Sorry, I hadn't noticed the price drop, and I quoted from memory. Gemulator was originally $299 wasn't it? Of course, the price probably dropped a looong time ago. Sorry, my trivia engine just conked out and I got the number wrong. (Now ask me "What is Boskonia"? and I might fare better!)

There's nothing wrong with my math:
2+2 = 5 (for sufficiently large values of two, and small values of 5)
6*9 = 42
Besides, I'm a CIS major. O(300) = O(200).
See? What's so great about the Canadian educational system anyway?

Like I said...even at $200, that's $200 of native software I can buy to replace my OLD ST software (that I can either SELL to get money to replace the software, or run on my old ST). $200 can buy me Excel and Word with some nice change left over (of course I DO get the nice edu price...but I think that even buys the street price of the combo deal as well). Of course I could buy REAL software instead, from a REAL software company. <g>

>Now if you want to purchase a 486 and sell off all your ST hardware and
>software, that's entirely your choice. It's something I've advocated for
>years. But like you said, if you had the money. Do you have the money to
>replace that Atari software with equivalent PC software and do it for under
>$200? I doubt it. That's why Gemulator is a nice $200 solution to that
>problem. Buy the PC and Gemulator. Then over time buy more and more PC
>software. Since there are a lot of Atari users in this predicament (i.e.
>they don't all have thousands of dollars lying around to buy tons of PC
>software), a market for Gemulator exists. People will buy it unless everyone
>suddenly wins the lottery. <grin>

Actually, I'm a bad judge for software. I use Stalker mostly....easy to replace. I don't buy much software...I've bought more Mac software, and I don't OWN a mac. Still, I made no beef with my opinion...If you are going to move, MOVE. For some, I do see Gemulator as a necessary step, and for others I see it as an attempt to keep that ol' Atari feeling around...mostly for nostalgia. I don't like colorized movies, so I do understand the nostalgia. Obviously I don't speak for everyone...or you wouldn't sell any product.

Rest assured Derek, if I win the lottery, I'll become a customer shortly thereafter. I really would like to play around with Gemulator. It'd be

worth it in amusemenet value alone (not to mention I might acutally put it to some real use). Heck I'll even buy it a FULL RETAIL if I win the lottery. Will you sign it for me? (I've asked God to let me win the lottery just so I can buy a PC and Gemulator. I expect to already have won...)

Otherwise, I factor in software prices as part of the upgrade. I won't buy a new computer without anything to run on it. I'd rather stiff it out for a few more months to add more money to the pot and then make the leap. Hey, it's worked for me in the past....The great thing about the ST is that they are so damned cheap it ain't worth sellin' (unless you just DON'T have the room). Who needs furniture anyway? Ahhhh! It's attack of the cable snakes!!!!

In article <260vpj$180@usenet.rpi.edu>, oyakea@warren1c.its.rpi.edu (Amalaye Oyake) writes:
|> 1) How much is the 14meg ram board ?
The actual boards cost around 65GBP. The RAM you must buy yourself and right now it's V. expensive.

|> 2) Are there emulators or accelerators (please be very specific) ?
FalconSpeed 286 Emu. Runs WIndows fine and inc olor at 1024x768x16 using windows drivers that come with it. Also runs as an accessory. 230GBP

|> 4) Can I use an slm printer on the Falcon ?
Not at the moment. If there is a solution it will be 3rd party.

|> 5) Is there any CD software for the Falcon ?
Not yet. Atari will be releasing a disk full of stuff soon-ish. There are of course many commercial disks you can use such as fonts, clip art, text files etc.

|> 7) How do I view photo CD applications on my falcon ?
I think Truepaint may have this soon. It is definitely being worked on by several different people.

|> 9) Is the Falcon a successful product ?
the big question! They are selling but not in huge quanitities but until recently there were back orders on them. I think the Falcon will still be a success as there is so much 3rd party support already. The ST didn't have it so good in it's eary days.

|> 10) What else is the dsp being used for in the Falcon ?
Answerphone, modem, MPEG, JPEG, fractals, Sampling, all sorts.

|> 12) What Graphic cards exist for the Falcon ?
Don't really need them. I run at 880x768x16 normally at 70Hz via BlowUp030. I have had interlaced resolutions of 1400x1280 with noproblems.

|> 13) Any Street fighter II or world heroes clone for the Falcon ????
I sincerely hope not! :-)

Does anyone here know anything about Lantech?
Is it any good? How does it work? And is it possible
to get software for it??

Why I ask is this advert that someone put on a local BBS.....

```
================================================================
L A N T E C H F O R A T A R I S T

- 10 Megabit per second
- Manual and 2 hardware boxes
- Sorry, no software
- I have no idea what to do with them, I just got them
at an auction!
- Best offer over $20 takes them.
================================================================
```

That's NZ$, works out to around US$10.. if I can get the software
I might actually buy this :-)

Craig.

>>on my Quadra at work all the time and I find it indispensable.

>Considering the fact that he also claims to have run MS Word ($295) and
>PageMaker ($579), do you *really* think he has a legal copy of XPress
>($599)? Or any of the other programs he mentions? Let's not be naive.
>There are some people (like myself) who purchased XPress for their Macs,
>and then there are others who can't be bothered.

I can't really think either way, because there has no real indicator that
the poster has legitimate copies or not. Actually, there is not even
an indicator that the poster is a "he", as you put it.

"Let's not be naive." When there is indication, yes, you can point it out.
Unfortunately, I can't seem to find any.

Ok, I know why you all speculate and assume that, but posting just that
plus a few words of your "comments", doesn't make much sense/help.

I can give you 100 scenarios that the poster COULD be not what you think:

1. The poster can be a female, or you have to say "oh, but most of the
time, it's male." that kind of thing.
2. One can get legitimate software from a cheaper source:
a. education price.
b. employee's price, or dealer's demo price.
c. wholesale price.
d. a second hand but legal copy.
e. get it free, from a drawing, promotion, or gift.
3. The poster didn't say he/she owns it, so he could have borrowed it,
although the legality of borrowing has lots of gray area. (and I mean
borrowing the whole legal copy.)
4. The poster is doing testing for work, so has all the access anyway.
5. He might already have an expensive real Mac, but somehow got hold of
an ST with a GCR, and curious if it runs...., so he can put it in another
room/office/home etc. (by he, I mean he/she.)

I know this is not 100, but you get my point. I can probably provide more
speculations that the poster might have legal copies, than what you can
speculate the person not to.

If you ask me how I "feel" about that post, I'd say I don't know. One doesn't have to claim "not guilty" all the time, to be free from the assumption of guilty. And one should not judge just from "gut" feeling.

Why am I posting this? Not because I feel that the poster might be legal or not about his software, since I can't really judge (I can make myself think either way, although it is quite likely that he doesn't really own those programs, but not because he didn't buy it because he didn't buy a real Mac either.). I am posting this, because I got into a similar situation once. I was posting suggesting someone to try look into the pricing and availability of MacII roms in Thailand, and I received a e-mail, saying that I was suggesting private roms sale there. Well, you get the rest of the story...

Bye,
David

From: nkjnf@alf.uib.no
Message-ID: <1993Sep2.104725.15730@alf.uib.no>
Source record: 201658

We try again:

Winx 2.1 is mentioned in the Readme-file accompanying GemView 2.46.
Version 2.1 of Winx presumably works with the UK/US TOS versions
(Winx 2.0 does not), since the author (M.Osieka) has already
provided a new version (1.3) of GemRam which IS compatible with these TOS-es.
Does anybody know where to download this program?
Has anybody successfully loaded Winx 2.0 under UK/US TOS-es by starting
GemRam 1.3 first? Perhaps this is not meant to work anyway, but ...

Richard Millar was sitting right next to Sam Tramiel. I've been in similar conferences, and believe me, you don't say anything that the boss doesn't want you to say when you're in such a situation.

I found the delphi conference to be singularly uniformative. Same old marketing-type hypeola, no substantive information. And replication of some of the more stupid lies, so I find it difficult to trust the information there any more than any other marketing "opportunity".

I'm looking forward to being able to get my hands on a *real* Jaguar. An afternoon with a screwdriver and inspection lamp will tell a whole lot more of the story than anything I've seen here, there, or anywhere.

Because nobody sells stuff cheaper simply because it costs them less to make.

Do Sega CD games cost less that Sega cartridge games? No. Atari says the games will be in the $40-$60 range. Will 3DO be in the $20-$30 range? I don't think so. MAYBE $40. Maybe.

You also have to realize that CD games generally take longer to develop, unless they make a game that didn't really need to be on a CD is the first place... Hence, a higher price to make up the cost.

If I recall correctly, I saw in the german ST magazin an advertisment of a firm, that manufactures some kind of converter, that allows a large EIZO color monitor to be used in all resolutions. However I don't know, whether this monitor is a standard multiscan or has some special features.
Unfortunately, I don't have the issues here in Canada, probably someone from Germany can fill in the missing informations.

Alexander

3501. PI Prize

Newsgroup: comp.sys.atari.st
Date: 1993-09-02 15:26:55 UTC
From: slyster@outb.wimsey.bc.ca
Message-ID: <slyster.06md@outb.wimsey.bc.ca>
Source record: 201673

Thanks to everyone for volunteering to write a TOS program that will calculate PI. Now.... to make it a bit interesting!

THE STUART A. LYSTER PI CALCULATION FOUNDATION ANNOUNCES.....

A $50 (Canadian) cash award to the person who writes a program (using ANY of the current algorithms - it is the prgrammers choice) that will calculate PI the "fastest" (see #5 below). The winner will be decided upon the following 7 grounds - the winner will be decided upon by Stuart Lyster - his decision shall be final and unappealable (not in quality, but in process!);

1) The program shall calculate the value of PI accurately using at least TOS 1.4. In case of a tie, the program that is compatable with later versions of TOS (including MultiTOS and GENEVA) will be declared the winner.

2) The program will include the ability to write the value of PI to the screen AND a disk (a hard disk is preferable, as someone might eventually want to calculate beyond the 720K size of a floppy). Writing the value to a printer is optional - but would be great for parties.

3) The program will indicate by a screen display WHICH algorithm is being used, and WHERE in the iteration process the program is currently working.

4) The program shall write to screen/disk/printer (see #2) the accurate digits of PI as they become established. (No fair simply reading the value of PI from a file and writing them to the screen. Cheaters who do this will have their computer infected with the "Jimmy Bakker" virus - a virus which promises to feed hungry children with your donations, only to have the money channelled off to Heritage USA!)

5) The $50(Cdn) will be awarded as follows:
- $15(Cdn) to the programmer of the program which calculates PI to 100 digits (accurately) the fastest.
- $15(Cdn) to the programmer of the program which calculates PI to 1000 digits (accurately) the fastest.
- $20(Cdn) to the programmer of the program which calculates PI to 10000 digits (accurately) the fastest.
Obviously, if a program does all three, then the total prize is yours!
The program will be timed using my 520ST (1 meg) using TOS 1.4.
The decision of Stuart Lyster is final. You may appeal to a

higher celestial power if you think it will do any good.

6) Programs must be in the possession of Stuart Lyster by Oct 31st, 1993. Stuart Lyster assumes no responsibility for programs he does not receive, even though someone "swears to God it was sent two weeks ago!"
Programs can be sent by disk to:

THE STUART A. LYSTER PI CALCULATION FOUNDATION,
13800 Blackburn Avenue,
White Rock, BC V4B 2J6 (Tel (604)536-5389)

... or by UUCODE through Internet. Remember, Stuart is a complete idiot when trying to use UUCODE, so the Postal Service is probably your best bet.
Winners will be announced in November 1993, and the cheque(s) will be in the mail then.

7) It is understood by everyone submitting a program, that their program will exist in the Public Domain for free distribution. If you do not want you name associated with the program, please say so!

Why do this?

Why not. Besides, the calculation of PI is a way of testing the calculating integrity of a computer, which has to do millions of operations flawlessly to get it right. A PI Calculating program is a good bench test.

It is either that, or we ST owners will have to get a life. Me, I'd rather watch digits flash by my screen.

> to 1280 by 1024 work on a TT and give both color and
> monochrome modes?
>
>Thanks.
>--
>Opinions expressed are my own.

The TT will use a standard VGA / SVGA monitor and can even use the cables
which come with most monitors (atari does sometimes use industry standards).
Due to the type of signal that the TT generates, though it is best to invest
a little more for a better grade monitor with very good resizing controls.

The higher resolution monitor will only help with an aftermarket graphics
adapter. The 1280x960 monochome generated by the atari is completely
different than the input needed by VGA compat's. This is very similar to
the older Viking monitors for the Mega series. Also, you will want a larger
monitor than the usual 13-14 inch models for resolutions above 800x600.

If you would like the higher resolution, I would recommend the Crazy Dots
graphics adapter imported into the US by Gribnif Software. On a good
monitor (a 16 inch NEC 4Ds in my case) it displays resolutions up to
1664x1200 in up to 16 colors and up to 1280x800 in 256 colors (I only have
the 8 bit version of the card, but I believe that either a 16 or 24 bit
version is also available.) The Crazy Dots card for the TT is a VME
expansion card and is easy to install.

Hope this helps...

|>An afternoon with a screwdriver and inspection lamp will tell a whole
|>lot more of the story than anything I've seen here, there, or anywhere.
|>

Oh, you were, perhaps, going to pry the lids off the chips and
see what's _really_ in there? I believe the original question was "Is
the 68000 a coprocessor or really the "main" processor?" If you can
tell that with a screwdriver and inspection lamp, I'll eat your shorts.
I think you might have better luck looking through some developer docs.
Some people here probably have access to those docs, but if they do it's
probably under non-disclosure so they can't tell us anyway.

Fumingly,
Eric

3504. Mutt Editor pl7 released

Newsgroup: comp.sys.atari.st
Date: 1993-09-02 17:33:47 UTC
From: christof@zarniwoop.pc-labor.uni-bremen.de
Message-ID: <CHRISTOF.93Sep2183347@zarniwoop.pc-labor.uni-bremen.de>
Source record: 201670

I have sent patch level 7 of the Mutt Editor to a.a.u.e. It should
appear there soon in the Newitems, but for those who cannot wait, it
is also here on 134.102.228.9 in pub/atari_st/me2

Pl 7 fixes some bugs, see the new patchlog for details.

For those who still do not know :-) The Mutt Editor is an editor in
the EMACS tradition (programmable in MUTT, a LISP-like language), i.e.
very powerful, though not *quite* as big. The atari GEM version runs
comfortably on any Atari and has a nice GEM interface with some extras
added.

The Mutt editor was written by Craig Durland
craig@cv.hp.com
The atari port was done by Jwahar Bammi
bammi@cadence.com
The atari GEM interface was written by Michael Brandt
mike@pc-labor.uni-Bremen.de
Documentation of the GEM interface and the atari (GEM version) changes
christof@pc-labor.uni-Bremen.de

Have fun with the Mutt Editor,
Christoph

Correction. Sega CD games ARE considerably cheaper than Genesis games. Take,
for example, you average Genesis game...most are at least 50 and up to 63
dollars. Your average Sega CD games is between 45 and 50 dollars. Look at
Ecco and Ecco CD, for instance. Ecco CD is cheaper although it is a better
game (better music, extra levels.)

What you've seen most probably was a 320x480 resolution in 32K colors; this looks very good for displaying real world images.

A PTCxxxx neither can do 640x400 nor 720x576 in True Color, since it doesn't sync to 15,6 kHz.

Message-ID: <1993Sep2.161944.16042@ac.dal.ca>
Source record: 201557

Hello,

I've been asked by a member of my local user group to see if any information's available about something called "Granular Synthesis". Here's his message:

Recently, I was told about a new digital synthesisor called Granular Synthesis and that it was being developed using Ataris at Simon Fraser University in the music department. Could you check on Internet for me about this? I've heard music by a Vancouver composer named Paul Dolden using this and liked it. Any more general information or a contact name would be great, thanks.

If anyone has any knowledge of this I'd appreciate hearing about it; either posting or email would be fine. TIA.

John

Don't we all hate slow modem connections that irregularly swallow
the typework you send, and after you angrily smash a bunch of keys
at random burp it all out in one go to make you sheepishly look
at the illiterate result?

Well, today it amused my old '87 1040ST to teasingly do the very same
OFF-LINE, when I was using 1stWordPlus, only 5 minutes after a
perfectly normal cold floppy-boot.
It literally echoed my typework within a delay, varying from 1 to 4
seconds. SCARY!

I immediately knocked him powerless, and after letting him repent his sins
for 10 sec's I started him up the same way. No more trickery came up.

QUESTIONS: * What the ??? happened ? Sleepy keyboard processor ??
* Does the fact that my soundchip is slightly damaged
(printerport lowest bit is always 1 - bye bye ASCII)
for already a few years come in somewhere ?

The floppy is VIRUS-free,
and I've started up with it as is for years by now.

A bit worried,
Thanks in advance,
Rowdy Blokland,
The Netherlands.

3511. SCART/color monitor questions

Newsgroup: comp.sys.atari.st
Date: 1993-09-02 21:32:36 UTC
From: gijs@mbase97.hacktic.nl
Message-ID: <H.eg.wpjlEGpvJKs@mbase97.hacktic.nl>
Source record: 201263

Does anybody have any experience attaching a color TV to an ST
using a SCART plug? I saw a scheme in a magazine, but before
spending hours on fumbling with wires I would like some assurance:
CAN IT BE DONE?

Does the Atari automatically detect that a color monitor is connected?
If so, how does it do it?

Can all Atari STs drive a color monitor? Can my 520ST+?

Thanks very much for any information!

Sir, if it's in your power, can you tell ATARI to do a
'STAR RAIDERS III: The Zylon's Imperium'

This game's gameplay has to be very close to the ORIGINAL Star Raider's
game for the Atari 400/800 computers.

Ah, but has to take advantage of the 3-D Texture mapping of the Jaguar.
Same control, add like 5 types of weapons, and add like 20 types of
enemy-spaceships.

I want you, as the pilot to be able to go to an enemy Zylon Space-Base
and blastit (like StarWars I).

The Zylon will try to destroy your bases too (like in the original game).

Make this game multiplayer.

But remember guys, the most important part, it has to have really cool
nice 3D-textured spaceships, bases, maybe even planets (have some
planet/bases fights with the Zylons) and ... in space has to have
exactly the gameplay of the ORIGINAL Star Raiders. So, the Jaguar
must be a Super-Set of this gameplay. Don't make it like the lame
StarRaiders II that was really bad in this regard.

This is by far one of my *ever* favorites. Please Please Please,
make it for the Jaguar (and for the Lynx!).

BTW, wanna get wild? Make the game multiplayer too so each player
with a Lynx can have 'their own screen' or something among those lines
and attempt to destroy a base or be working in parallel.

Although I would like CD-32 to sell and it's true that the future
media will be CD which will make 'cheaper cartridges' keep in mind that
a very well done CD game might actually cost a lot because of the memory,
and that if the initial system is cheap, it might actually sell more.

It all depends. Actually what you say could help CD-32 or could hurt
it. Both are possible.

True, but I just wanted to remind you that the ooooooooold ATARI
had success IN SPITE OF its management. I remember those 'ANALOG'
magazine articles, where they predicted like 1 year before that
ATARI would be in bad bad trouble - which happened to them (before
the Tramiel era).

So that ATARI wasn't very good either :-|

3520. Problem with Chaos Engine demo

Newsgroup: comp.sys.atari.st
Date: 1993-09-02 22:44:57 UTC
From: ortega@cactus.org
Message-ID: <1993Sep2.224457.12661@cactus.org>
Source record: 201689

I'm having problems with the Chaos Engine demo on the
cover disk of ST Format #49.

It seems to be caught in a loop where it trys to cold boot
again and again.

I have a 1040STf with 1 meg.

Transferred is easy, shared, especially when you have several different
operating systems, is not so easy.

>The software should be simple and easily portable; the hardware required
>should be limited to a serial port. The machines might include virtually
>anything - CP/M, Atari, Amiga, 6809, and whatever, even small SBCs.

>Has anyone set up such a configuration? We've discussed the following
>possible approaches:

Yes.

>1. KA9Q TCP/IP using SLIP. Routing programs would run on multiport machines.

As long as you have a functional C compiler for each platform, and you are
not afraid to get a little dirty, this is the superior solution.

>2. Using a small SBC to convert between RS-232 and a 9-bit network.

Bad idea. You'll have to implement a protocol on the 9bn to encapsulate
whatever higher-level protocol you intend to use.

>3. UUCP.

Spectacularly unimpressive. Probably harder than 1.

>What I do in my setup now is use Xmodem. It seems to be the only common
>transfer protocol. I'd like to change to Zmodem, but by the time I do that
>it might have been easier to port UUCP.

Depends again on whether or not you have a C compiler for each platform.
There are some reasonably portable Zmodem implementations around.

>This would appear to be a common problem, though. I imagine someone out in
>netland has already solved it, at least partway. How did you do it?

Ported KA9Q (or the parts I needed) to the micros, used exisiting ports on
other machines. The beauty of that is that when you bring in a higher-end
system (in this case a unix box) you have nothing to do - in our case, Ultrix
even had VJC SLIP already implemented. (CSLIP)
I used a common interface - a script, (where the local system had the ability)
or a monitor command :

getme <file> from <system>

This initiated an ftp session to get the file from the named system.
Worked well, very quick.

>looking at those 1M image arrays in 64k chunks...) and the famous 640k
>limit (actually a 1088k limit these days) are death.

This depends on whether you need to support < 386 machines or not. If
you don't have to, get DJGPP (the DOS version of the GNU C/C++
compiler) and use it. It creates protected mode executables, which
means that all of the above is irrelevant and you get a nice flat
memory model with no brain-damaged limits, just like you're used to.
It evens gives you virtual memory. Porting Unix stuff is often trivial
with DJGPP.

>Try OS/2 or linux; it'll make life much easier (well, Linux sure won't,
>unless you know much about unix systems administration... I sure don't).

This will work too.

Does the Star Raiders II cart work with the Atari800XL?

Anyway, they should make Star Raiders III more in depth. I LOVE
a good first person space epic.. heck, I even loved Star Voyager on the NES.

1) Make the dogfights more Wing-Commanderish. Ya know, lots of
chasing, weapon selection, technique, etc. BUT...have obstacles... just
like in Space Lords.. gas clouds, Asteroids that don't move that fast
etc... (only in some areas.. make some areas less dense, bare, etc.)

2) Make the bases more detailed. Weapons shops, shipyards,
bars, pubs, space fed offices to sign up for missions, army service etc.
That way you can go on little missions agains the Zylons etc., transport
ships to other areas, invasion missoins on Zylon outposts etc.

3) Cinema displays... GOOD cinema displays.

4) A slight RPG element... how about being able to land on planets
and explore? Encountering monsters, NPCs, etc.

5) Have planet missions as well. Kinda like Epic...go down on the
planets surface to blow up outposts, aid in Civil wars etc.

6) Make MANY sub-plots so it takes you a LONG TIME to actually
crush the Zylon empire. When the game starts... you've been away from
the academy (or whatever) and you're looking for various jobs/quests etc.
Eventually, you find yourself back in the academy (but you could land in
different segments... commando forces, mercaneries, etc.) That way you
have a lot of different directions to go in, instead of the standard linear
plot.

7) Have certain areas of uncharted space available through wormholes
etc... that way you can pick up alien technology etc. There could be parts
of the game where you land on alien planets, possibly friendly. .. that way
you could get some bizarre technology... and join in the alien civilization's
own plights against enemy forces etc.

8) Make different types of star bases, ports, planets, galaxies etc.
Each having different characteristics...

This should all be possible on CD... especially with Jag-PEG and all.

Atari Lynx games list (last update 8/17/93)

== Available Now (Atari Corp. and third-party) ============================
62 games -- Titles listed in order of release

California Games Blue Lightning Electrocop Gates of Zendocon
Chip's Challenge Gauntlet: The Third Encounter
Todd's Adventures in Slime World Klax Xenophobe
Robo-Squash Paperboy Roadblasters Ms. Pac-Man
Zarlor Mercenary Rampage Rygar Shanghai
Warbirds The Fidelity Ultimate Chess Challenge
Blockout Ninja Gaiden Pac-Land A.P.B.
Turbo Sub Scrapyard Dog Checkered Flag
Ishido: The Way of Stones Qix Viking Child
Robotron: 2084 Hard Drivin' S.T.U.N. Runner
Bill & Ted's Excellent Adventure Awesome Golf
Tournament Cyberball Xybots Crystal Mines II
Toki Super Skweek Batman Returns Rampart
Hockey Hydra Lynx Casino Basketbrawl
Kung Food Steel Talons Shadow of the Beast
Pinball Jam NFL Football Baseball Heroes Switchblade II
World Class Soccer Dirty Larry: Renegade Cop
Dracula the Undead Joust Pit-Fighter
European Soccer Challenge Dinolympics Power Factor
BattleWheels Gordo 106

>Is it true that Star Raiders is being developed for it?

A title called ULTRA STAR RAIDERS is/was in development for the Lynx. The state of that (and many other Lynx titles) has been in limbo for most of the year, since everyone's going Jaguar-happy. I'm hoping for a chance to get some dope on the situation in September.

3527. Demos that work on Falcon030??

Newsgroup: comp.sys.atari.st
Date: 1993-09-03 04:15:26 UTC
From: saj@chinet.chinet.com
Message-ID: <CCrFtr.Hot@chinet.chinet.com>
Source record: 201697

Show-off demos are, in general, pretty sensitive to hardware changes. But still, I wonder if some of the contents of that impressively big Demos directory on a.a.u.e run on the Falcon030. Anyone out there with a fair size collection of demos and access to a Falcon? I would hope that if some are found to be Falcon-compatible, the information would get into the 0index file at the archive, too.

Steve

Just out of curiosity, doesn't Goldleaf also develop for NeXTStep?

3529. Jove and CSTeX

Newsgroup: comp.sys.atari.st
Date: 1993-09-03 05:18:29 UTC
From: marshall@cs.uq.oz.au
Message-ID: <15241@uqcspe.cs.uq.oz.au>
Source record: 201696

I tried posting this before but I don't think it made it! Aplogies if it did.
I set up CsTeX to use jove as its editor. When TeX reports an error, and I respond with "e", jove is entered and editing is OK. But when I exit from jove, back to TeX, the mouse cursor disappears, and nothnig I have tried will bring it back. It's as if the mouse has been lost. If I exit from TeX and reopen it, the cursor returns. Same happens running under Gulam or desktop.
I have tried other editors and this doesn't happen with them.
I have a 4Mb MegaSte with TOS2.5 :(
I'm using the latest vn of jove, from a.a in Gnustuff. I'm running it on a mono screen at 50 lines /screen.
Any hints? Thanks.

That's not necessaryially true. Not every OS will let DOS access any ol'
card. I think that both NT and NeXTSTEP might not like DOS accessing
hardware directly. I think that OS/2 is pretty laisez faire about it,
so it should work.

Anyway, I'd perfer to let Darek answer it. He's in the position to have
at least attempted it, and he should know lots more about it than I.

>Are you sure about those prices, $200 for both Excel and Word?

Yes, but I guess I was wrong about the normal retail price. From our
campus price list (WINDOWS):

X4567 VALUE PACK WORD & EXCEL WINDOWS SOFTWARE 3.5 166.25

I could buy it and have some change left over. This doesn't go for
every one though. When I bought the mac package, it was only $130! Then
I upgraded to Word 5.1 for $15! (To bad it's so damn slow!)

From: sdaveyj@cc.curtin.edu.au
Message-ID: <1993Sep3.160056.1@cc.curtin.edu.au>
Source record: 201553

Hi,

I'm looking for a reliable supplier of the speed-up board for the
Atari STE (16Mhz jobbie)

Faxes to a british company from here in Oz have received no reply.
Could anybody out there suggest a way of getting one of these
devices from Australia, and also your experiences with particular
companies.

I have written this for my brother in law who has the STE, but I have
an Acorn Archimedes, so can you please reply directly to me, as
I don't read this newsgroup as a regular thing.

Thanks people,
back to my 25Mhz 13.5Mips RISC
(sorry, I couldn't resist that)

John

What about the Minidisc? It certainly doesn't store 600 megs but quite a lot all the same (does anybody know exact figures?). Whatever the price is going to be, it will probably show that optical disks have so far been sold for way too much money.

> Steve

Ok, I've got a fair few demos for the ST, and have had a Falcon for a while.
The only ST demos I have that work with the Falcon at all are old ones, I'm
afraid, and they will only work if you are using a software utility like Magi to
improve backwards compatibility. The only demos I have tried that work to a
reasonable degree are -

Lost Boys 'Life's a Bitch' - rather old...
TNT Crew 'FNIL' - very old!

Of course, the Omega Grotesque demo works on the Falcon, but that has been
uploaded to the Falcon directory on Umich, so I guess everybody already knows
this.

Most of my other demos like Cuddly, Mindbomb, Oooh Crikey etc. will not get past
the boot loader. (Some of these might be patchable... anybody?)

The main problem is that even using something like Magi, there is a fundamental
problem with Falcon compatibility - it is called the 68030. The 68030 uses a
different stack frame to the 68000, and there is _no way_ to fix this. Many demos
that do not work die because of this, notably 'HiFi-Dreams' by Aura, and many
groups soundtracker replay routines assume they are using 68000 stack frames.
Result - instant program death.
That's life.

Oh, by the way, I have a little patch program that a friend wrote to get the
game 'Warhead' by Glyn Williams to work on the Falcon. If anybody wants it then
get in touch and I'll see what I can do. Don't worry, it doesn't involve any modifications
to your original disk.

Cheers
- Andy.

SOME are cheaper, but I wouldn't say considerably cheaper, and certainly not
half price. Most are cheaper because they're not games people are drooling
over. And because Sega wants people to be enticed to buy the Sega CD

Ecco was out for quite a while on cartridge before coming out on CD. It's
kinda hard to justify a high price. Who would buy it?

3541. Falcons sold

Newsgroup: comp.sys.atari.st
Date: 1993-09-03 13:30:42 UTC
From: eang62@castle.ed.ac.uk
Message-ID: <CCs5J7.B4q@festival.ed.ac.uk>
Source record: 201559

So Atari's turnover in the second quarter was 6 million? Lets assume they are only selling Falcons. If they pass on each Falcon to the distributers at 500 dollars each, then they must have turned over about 12,000 units, thats 4000 units per month WORLDWIDE. I'm sure you'd all agree that this is absolutely pathetic. It's no wonder that the price of the
Falcon hasn't come down, they're not selling in volume. I imagine this must be due to production problems rather than demand? It's been out for a year (I saw it a year ago at the German show), still the original design, and the price is exactly the same. At this rate they havn't a chance.

>
>--
>Warwick

Ah, WHY,pray-tell. is RAM "valuable" these days? Heck, you can populate
a game system with a few MB of RAM without affecting the price that
much. RAM, purchased in high volume, is quite inexpensive.

CD-ROMs continue to be VERY good for yhr storage LOTS of voice, video, and other
digitized data that WOULD, even if compressed, cause carts some storage
problems. Sega, NEC, and others have yet to really cash-in the the storage
capabilities of CD-ROMs. Heck, there is no reason that we shouldn't be seeing
even flashier, more complex games, or multiple games on one CD-ROM, etc.

>true? Can we then expect Falcon only apps to be a little more memory
>hungry than their ST counterparts?

That's a direct side effect of programming in the Large/Huge/Extended Intel memory models. Since all 68K family members use 32 bit addressing (logically, not necessarily physically) there's no similar side effect. There are a couple of other effects though - if you specify 32 bits as the default size of your C int's, yes, you use a little more memory. But if you compile to 68020-specific code, you can save memory as well, using the newer instructions.

It's difficult to make the comparison. Definitely, on a 68000, you use more memory and slow things down by specifying 32 bit ints instead of 16 bits. On a 68020 and up, if you get to use the 32 bit multiply/divide and other new instructions, you tend to speed things up...

> The dos rates are about what I've seen, but linux manages to go a

>he was up to 1200. ;-)

Not strange at all; my point is that SCSI is not well integrated in any current PC-style boxes. It's no surprise that your IDE drive rates better, your SCSI is being choked by a poor system design...

> Another thing to consider is filesystem speed. It doesn't matter how
>fast your raw disk speed is if your filesystem slows everything to a

True.

>like ratehd that does bare metal speed testing and linux doesn't
>provide an unbuffered disk i/o device.

Just create a 64 MB file and time how long it takes to read it. The actual file size is relatively unimportant, as long as it's significantly larger than your filesystem cache size. Likewise for write speeds...

> Is there a dd for MiNT? If there is, could someone with a tt run

>interested in higher level speed test results.
>
>time dd if=/dev/sda of=/dev/null bs=1024k count=100

I don't believe MiNT lets you write to a raw drive... But you could get
relevant data for TOS and Minix filesystems, at least.

Well, in my case, you'd be dead wrong. In the general case, I'll concede the point.

>In short, linux is rather lean by unix standards. It's all that extra
>"junk" like emacs, X, and gcc that eats all the space. It's great having
>lots of freely available/portable software at your fingertips.

Sure is. It must be nice for those poor Intel guys who are finally able to run some of the Unix stuff now... Not that TOS is a wonderful system to work in, but at least we didn't have to throw away the native OS just to be able to run Unix-derived applications. Nor did we have to wait for several generations of processor to evolve (8086->186->286->386) before even being able to think about running such software...

Sorry, I guess that's a throw-away line, preaching to the converted...

>> Not at all. A non X linux can run on 2 meg. A bit of swapping, maybe
>> but there are people with X windows equiped 4 meg laptops. With a

>Yeah, just a little quicker. <grin>

Ah, now you're mixing things up a bit... I'm sure KA9Q compiled for a 486 would give you equivalent TCP/IP performance compared to the Linux code. You can't blame all of the perceived slowness of a program solely on the program itself...

>Hah. I haven't run iozone yet, but I am quite confident that my

>reads against many megs of cheap memory.

Think again - at least in Atari-land, code in a ROM-cartridge is executed directly from the cartridge; the cartridge contents appear directly in the system memory map. Thus, there's no load-time, there's no RAM wasted in copying code from ROM to RAM, and there's no latency in accessing a particular piece of data. Of course, if you decide you need even more capacity than what's directly available, you might go to the effort of compressing the stuff in the ROM, and then you'd need RAM to decompress it, but usually folks would just cram in more ROM and bankswitch it...

>This will work too.

Having just ported a Atari GEM program to MS-Windows, I can speak from
experience.

It can be done, even without these tools, but it isn't much fun. The
segments do indead pervade (pervert) everything, and you must surely
watch your step.

I must add, though, that programming for MS-Windows is much easier than
for GEM: it is much more modern, and given its history even surprisingly
consistent. Yeah, yeah, I know, it does have its problems, but compared
to GEM...

One thing that surprised me was the sorry state of C compilers.
Turbo C and Borland C, supposedly the points of origin of Pure C, are
certainly *inferior* to Pure C. Yes, they have C++, but the shell is less
easy to use, and what realy surprised me was that Borland C is easily a
factor two *slower* than Pure C, even on my 486SX at 33Mhz.

Finally, if you plan porting a GEM program to MS-Windows, forget about
trying it with judicious use of #ifdef or something like that. GEM
and MS-Windows are too different for that.

Although I can't recommend a cute one, I can give you a hand with some per-
fectly functional ones... I use Paula 2.1 as an ACC (should be PAULA_21.ZOO
or something like that at aaue. It's in atari/Ste/Mods, if memory serves
me right--just useArchie). I've also used JUKEBOX.ACC and MODPLAY!.TTP.
Hope that helps!

Well, yes and no. It is actually being used as a CPU in it's own right, but on most game systems these days (including arcade games) the Z80 is used as an I/O and sound interface CPU instead of the main CPU. I guess you could call it a coprocessor, since that is what it is doing, but the term 'coprocessor' implies a very restricted type of operation, and the Z80 is generally doing quite a bit more than the typical coprocessor.

Without any form of compression they will happily accept 140Mb on one minidisc,
my guess is that they'll remove the compression involved in the music-minidisc
(impossible to apply on raw data) and use some other form of compression and
sqeeze in 200-300Mb ... (on soft not already compressed ofcourse)

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <89678@cup.portal.com>
Source record: 201474

The figure of 12,000 Falcons sold would only hold up if they were the ONLY thing Atari was still selling.. they actually do sell a few other things now and then, so the actual figures are less... much less.

The last number I heard estimated was that there exist something like 5000 Falcons in the entire world.

Also from reports I've heard, supply doesn't seem to be the entire problem. There was a brief spurt of sales at first, but those who already knew about the Falcon, and who wanted one, seem to have bought up the first units already. And since no one else in the world has ever heard of the Atari Falcon030, there is very little demand now.

BobR

That's pretty bad. I thought someone in the UK had said that there were
supposed to be 7,000 Falcons sold over there?

(not that 7,000 is a lot in a country of that size)

This is NOT good.

However, the thing that is odd is that they seemingly have more potential
dealers (via music stores especially) so something is fundamentally wrong
here.... perhaps the lack of marketing has gotten to the Falcon.

3568. FASTPROG.ARC in archive.umich.edu

Newsgroup: comp.sys.atari.st
Date: 1993-09-04 06:00:39 UTC
From: Hiram.Lester@launchpad.unc.edu
Message-ID: <269au7$25b@samba.oit.unc.edu>
Source record: 201592

I recently FTP'd a file named FASTPROG.ARC from atari.archive.umich.edu. When I got it, I discovered that it was a VAX/VMS file not an ST file. This is fine since I am using a VAX, and that is the reason that I FTP'd it in the first place. I sent the FASTVMS.EXE file back up to my VAX where it appears to work, but the problem I am having is since it did not come with a program for the ST, what protocol does it use, and how do you use it? I have had no luck since there is no documentation with it either. Any help would be appreciated.

==========
It literally echoed my typework within a delay, varying from 1 to 4
seconds. SCARY!
==========

This is a common bug in the computer. I get it pretty often. Usually, the delay isn't timer based but your keyboard will lag behind by a few characters or you could move the mouse to make the rest of the characters appear. Mouse clicks are delayed in a similar manner.

A related bug is "phantom typist" in which instead of lagging behind it does the opposite and "lags ahead". It literally takes the last few characters or words that you typed and repeats them infinitely until you reboot. Don't type too fast and don't move the mouse whiel typing 1000 words per minnute or anything. It seems the problem is in the microcode for the keyboard processor or something. JUst try your best to save what you were doing (if possible) and reboot (warm reboot will do it).

In the text taken from skychannels text-tv that somebody posted here a
while ago they said like this:

---
does not seem to be doing much. The
specs on this machine sounds great but
with only UK sales of 7,000 the user
base is nearly non existent. So enter

So unless I understand that incorrectly, they (?) are saying that
there are 7000 Falcons in the UK.

rest deleted

But I wouldn't call their distribution world wide in 2nd Q. We had maybe received a shipment or two by then in the US and I don't think Canada had received any. The Germans and Dutch and NL were still looking at selling all they could lay their hands on so those markets weren't satiated yet. If you had followed their disasters with the quality assurance ordeal you'd also understand why their ramp up has been slower than you might have expected. I suspect you will see a significant difference in their 3rd Q report this year. (And that will be based on Falcon sales - not Jaguar sales.) Wayne

>tell that with a screwdriver and inspection lamp, I'll eat your shorts.

Do you seriously think that's the only question, here? And do you have any idea how much interesting information can be had by looking at the actual hardware? Some of the more obvious things that might be answered include the existence/non-existence of a true 64-bit memory bus, the nature and speed of the memory chips inside, the abilities of the I/O ports to be interfaced to other devices, and a lot more.

>I think you might have better luck looking through some developer docs.
>Some people here probably have access to those docs, but if they do it's
>probably under non-disclosure so they can't tell us anyway.

Like you said - developer's docs seem to be non-existent right now. The thing that I'm saying is exactly what I've always said - until we see an actual unit, and get some actual specs as opposed to marketing hype, we won't know what's inside there. We might be able to *guess* (and all I've been trying to do is to guess with a little intelligence, based on my experience in the industry), but it's still a guess - and I'll cheerfully admit that my opinions are guesses, how about you?

>I don't think so. MAYBE $40. Maybe.

Why not? CD-I games are in the $20-$40 range, with most around $30.

>You also have to realize that CD games generally take longer to develop, unless
>they make a game that didn't really need to be on a CD is the first place...
>Hence, a higher price to make up the cost.

Hardly the determining factor. Do you really think that the development
costs of a cartridge are *that* expensive? The costs are eaten in volume.
And for a cartridge, one big aspect of the cost is the licensing - Nintendo,
for example, charges an arm and a leg - and can get away with it, because
only Nintendo cartridges will work on Nintendo machines. CD-ROM hasn't
got *that* problem, at least...

3575. double-sided disc drive

Newsgroup: comp.sys.atari.st
Date: 1993-09-04 12:57:37 UTC
From: sss@CUNYVMS1.GC.CUNY.EDU
Message-ID: <1993Sep4.125737.16584@timessqr.gc.cuny.edu>
Source record: 201583

I am still looking for an external double-sided disc drive at somewhat
less than the new price. If anyone has one in good shape for sale, contact
me at sss@cunyvms1.gc.cuny.edu.

Thanks,
Stephen Slottow

3576. gcc 2.4.5

Newsgroup: comp.sys.atari.st
Date: 1993-09-04 13:50:03 UTC
From: tiemann@stud.ee.ethz.ch
Message-ID: <tiemann.747150603@elektra>
Source record: 201463

Hello all GNU experts,

I had gcc1.04 running on my Atari TT without problems. Now I tried
to update to a version >2.4. I downloaded 3 different versions but
I have always the same problem.

The last version I tried is gcc2.4.5 from ftp.uni-muenster.de.

The 'gcc' program tries to call 'gcc_cpp' with the option '-lang-c'.
But this option is unknown to the preprocessor.

This is the output when I'm triing to compile 'mint'. The '-v' flag
is set:

```
-------------------------------------------------------------------------
F:\FIDO\ARCHIV\MINT108S> make mint.prg
gcc -v -G -Wall -O2 -fomit-frame-pointer -mshort -DMULTITOS -c console.c -o co
nsole.o
gcc-atariST version 2.4.5 Patchlevel 1
d:\gnu\gnu\lib\gcc_cpp.ttp -lang-c -v -undef -D__GNUC__=2 -Datarist -Dgem -Dmc6
8000 -D__atarist__ -D__gem__ -D__mc68000__ -D__atarist -D__gem -D__mc68000 -D__O
PTIMIZE__ -Wall -D__MSHORT__ -DMULTITOS console.c /tmp/cc100000.i
d:\gnu\gnu\lib\gcc_cpp.ttp: Invalid option `-lang-c'
make.ttp: *** [console.o] Error 1
F:\FIDO\ARCHIV\MINT108S> cd $TOPWIND
D:\GNU\GNU\BIN> gcc_cpp.ttp -lang-c -v -undef -D__GNUC__=2 -Datarist -Dgem -Dmc6
8000 -D__atarist__ -D__gem__ -D__mc68000__ -D__atarist -D__gem -D__mc68000 -D__O
PTIMIZE__ -Wall -D__MSHORT__ -DMULTITOS console.c /tmp/cc100000.i
D:\gnu\gnu\lib\gcc_cpp.ttp: Invalid option `-lang-c'
-------------------------------------------------------------------------
```

I don't know what's wrong. Perhaps the environment variable setting?
Here's mine:

```
-------------------------------------------------------------------------
setenv gnudir d:\gnu
setenv gnu ${gnudir}\gnu

export GNULIB="${gnu}\lib"
export GCCEXEC="${GNULIB}\gcc_"
export G++INC="${gnu}\gxx_inc"
export GNUINC="${gnu}\include,${gnu}\gxx_inc"

export CC="gcc"
export C++="g++"
-------------------------------------------------------------------------
```

Could perhaps someone mail me his setting?

Feel free to post or mail any hints.

Greetings
Bjoern

3577. Welcome to comp.sys.atari.st!

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
TT, and Falcon. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:
```

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:EMILY: ??.??.??
Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of _humor_.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways), Emily has taken time out of her busy schedule to answer a few commonly asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.

Flame wars are fun. They're the main reason people creted Usenet,
and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV: 93.06.11
How do I become a developer for the Atari ST?
==========

Contact Bill Rehbok, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Bill can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Bill for

more information.

Atari is now selling the developer's kit (or parts of it) seperately. No project-in-development or non-disclosure agreement is necessary.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10

General error.....-12
Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4

```
Access denied..................-36.............5
Invalid handle.................-37.............6
Insufficient memory............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified........-46............15

No more files..................-49............18
Range error....................-64............33
Internal error.................-65............34
Invalid program load format....-66............35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

What is Free-Net and how can I get access?
==========

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't

post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to
myself via the e-mail addresses above or by writing the SIG at its US
mail address:
The Atari SIG
P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

What magazines are available for the Atari ST?
==========

If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.

As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> and Kevin Busby <kevinb@syma.sussex.ac.uk> for some of the info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

12 issue Subscription now:
With Disk 6 Mags Without Disk Mags

UK: #26.50 #18.00
Europe (air) #30.50 #21.00
World (air) #38.50 #31.00

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Future Publishing, Somerton, Somerset, TA11 6TB Tel. 0458 74011
Fax 0458 74378

Atari ST User:
---

like ST Format. Generally (amongst online users) thought
to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so
polished. 1 cover disk per issue.

Subscriptions: PO Box 500, Leicester, LE99 0AA. Tel: 0858 410510.

There are also, I think, some MIDI mags with strong ST content. I don't
have their names.

German Mags:

ST-Magazin, TOS, and ST-Computer united in August 1993 to the
"ST Computer", which is the only remaining magazine in Germany.
(I don't know if the following info still holds, then. --Steven)

ST Computer:
---
11 issues/year, typical around 180 pages
Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)
Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

French Mags:

ST Magazine

Monthly in French. Oriented towards developers, professional users. Comes
with a disk each month.
ST Magazine - 10, rue Hegesippe Moreau - 75018 Paris - France
(French Teletel users: 3615 Teletel access, code STMAG)

STart Micro

Monthly, includes a cover disk. 11 issues per year. 64 + 16 (separated) pages.
Price: FF38 per issue, subscription: FF360. Subjects: Desktop publishing,
graphics, initiations to C and GFA Basic, survey of outcoming software, music,
folders. Minitel access: 3615 code ATARI. Address: FC Press, 57 rue Danton,
92300 Levallois-Perret, France.

Dutch Mags

ST, published by Stichting ST , postbus 11129 2301 EC Leiden the Netherlands
---
cover price: fl 6,95
Independent magazine by and for atari ST users.
covers all different topics from applications to games and hardware.

60 pages.

6 times a year. One year subscription fl 35,-
black and white pages.

Atacom, by Atari Club Groningen.

Never seen this one. I suppose you have to be a member of the club or so.
price is fl 4,95.
Adress of the club: Atari Club Groningen, Postbus 9164
9703 LD Groningen, the Netherlands.

Atari Nieuws, by Atari ST computer club Nederland

News paper sized publication. Lots of colour on newspaper pages. Not too many
pages though.
price is fl 3,95 (cheap cheap)
monthly publication.
adress: ACN, Postbus 5011, 2000 CA Haarlem, the Netherlands.

GFA-info, by GFA gg (usergroup)

Publication of the GFA-basic usergroup. This group has a lot of mainly
educational software available.
price is fl 5,00

adress: GFA gg, Frankrijklaan 14, 2034 BA Haarlem, the Netherlands

ST News, by Stichting Computers Eindhoven

This is an electronic magazine. It has been around for about 6 years now
and is completely in English!!! The first issues were in Wordplus format
back in 1986 but from the 6th issue on it included a readerprogram
both for color and monochrome. Even with music.
price is fl 10,00
adress: S.C.E., Kornoeljelaan 22, 5552 RC Valkenswaard

Swiss mags:

Atari ST News Schweiz

Dutch Atari ST Nieuws translated into German for the Swiss :-)

:TIPS: 93.06.11
TIPS AND HINTS from other users
==============================

Any 'multisync' monitor which handles 70 video fields a second can be used
with the ST; the custom cable involves no tricks, or commercial ones are
available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are
tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0). This can be done with either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

On the Desktop, holding the right mouse button allows you to manipulate files in other windows. This is useful for a number of reasons. An example is this: say D:\BLAH.ARC is a file you would like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then hold the right button while double-clicking ARC.TTP in an inactive window.

:ZNET: ??.??.??
Where can I get copies of ZNET?
==========

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR: ??.??.??
Where can I get copies of Atari Explorer Online?
==========
Atari Explorer Online magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

Atari Explorer Online and some information from the Current Notes user
magazine are also available from the atari.archive server under
/atari/magazines.

:PD: 93.06.11
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ZIP, .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu,
jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or
weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP: 93.05.05
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

src.doc.ic.ac.uk

This site has a mirror of atari.archive.umich.edu in /computing/systems/
atari/umich.

:COMP: 93.03.01
Atari-related companies
==========

This is a (still under construction) list of companies and addresses that
might be of use to Atari ST users. Please send me addresses for the blank ones
on this list. See also IAAD, it lists many more companies that are not on
this list.

Archive-name: csas-faq/part2

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question
to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Entries are dated by the last change. ??.??.?? means they were last changed
before the dates were added.

The following is an index of the questions answered in this part of the FAQ.
For easy access to a particular question, search for the tag surrounded by
colons (i. e. :GNU:). Questions marked with '*' are new or changed.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
TT, and Falcon. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.
```

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ARCS: 93.06.11
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC, .ZIP and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ZIP Use UNZIP.TTP or STZIP.PRG
ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

stzip22.lzh - STZip, with GUI interface

unzip41.lzh - Old version of unzip

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using
zoo21.ttp.

:MSA: 93.06.11
Some info on Magic Shadow Archiver
==================================
(This was provided by Chris Herborth)

MSA Archives

The Magic Shadow Archiver (MSA) is a disk archiving program that allows an entire disk to be compressed into one file for transmission. The Magic Shadow Archiver (in shadow.[arc?|lzh?|zoo?] on atari.archive.umich.edu in ~/Archivers) creates .MSA files, which are often compressed using a normal archiver, such as zoo or lharc.

Magic Shadow is notoriously bad when used on a 1/2 meg ST and only one floppy drive. Its disk access and memory use are very badly thought out, and could result in over 160 disk swaps when unpacking an 80 track, double-sided disk.

Due to the fact that it was the _only_ disk image archiver around for quite a long time, Magic Shadow is the de-facto standard for creating disk images of computer demos and other pieces of software that cannot be easily compressed as files.

Because MSA files are disk images, they can only be used to recreate a floppy disk. There is (currently, see below) no way to extract the files from an MSA archive without writing it to a floppy disk.

Magic Shadow works perfectly with any legal TOS floppy format, even high density disks found in modified STs and most MegaSTes and TTs.

Chris Herborth (herborth@pinot.waterloo.ncr.com at work,
cherborth@semprini.tdkcs.waterloo.on.ca at home,
C.HERBORTH on GEnie) is writing a much more efficient MSA extractor, called UnMSA. UnMSA will minimize the number of disk swaps, and speed decompression considerably.

Daryl Richards (no email address, yet) is working on an MSA-Mounter, which will allow someone to unpack an MSA archive to RAM or a file on a hard disk. This uncompressed disk image will then be added to the system as a logical drive (much the same way a RAMdisk adds a drive to the system). MountImage on the Mac is an example of the way MSA-Mounter will eventually work (MountImage is so good, you can install new versions of the Mac OS using floppy disk images stored on your hard drive).

There is yet another MSA archiver now, called MSA II, by Phillip Lang.

:CLI: ??.??.??
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

master MS-DOS/Unix mixture, shareware.

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3

```
CRC error.....................-4
Bad request...................-5
Seek error....................-6
Unknown media.................-7
Sector not found..............-8
No paper......................-9
Write fault..................-10
Read fault...................-11
General error................-12
Write protect................-13
Media change................-14
Unknown device..............-15
Bad sectors on format.......-16
Insert other disk............-17
Invalid function number.....-32.....1
File not found..............-33.....2
Path not found..............-34.....3
No handles left.............-35.....4
Access denied...............-36.....5
Invalid handle..............-37.....6
Insufficient memory.........-39.....8
Invalid memory block address...-40.....9
Invalid drive specified.....-46....15

No more files...............-49....18
Range error.................-64....33
Internal error..............-65....34
Invalid program load format....-66....35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

```

:GDOS: 93.05.05
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called SpeedoGDOS, which should be available commercially from Atari. It is currently included with AtariWorks, and some Falcon packages. SpeedoGDOS uses scaleable fonts - you do not need to create a font file for every point size. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within SpeedoGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

In the UK The ST Club (2 Broadway, Nottingham, UK NG1 1PS. Tel 0602 410241, Fax 0602 241515) is a licensed GDOS distrubutor:

Catalogue No's:
GDOS-A Driver + Fonts 9-pin
GDOS-B Driver + Fonts 24-pin
GDOS-C Installed system for Opus (9 pin)
GDOS-D Opus 24-pin
GDOS-E FontGDOS + drivers
GDOS-F 300dpi printer fonts

Disks 2.95 pounds each.

:GNU: 93.06.11
What GNU software is available for the ST?
==========

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at most European FTP sites. The latest version of GCC available for the ST is 2.4.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.4.2 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System

SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM: ??.??.??
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG: ??.??.??
Public Domain/Shareware languages...
==========

There are a large number of programming languages available for use with the
Atari ST. Programmers seem to flock to the Atari ST, and if you know of a
language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN

FORTH
FP
Hope
ICON
LISP
Little Smalltalk
Modula2
OPS5
perl
PROLOG
SCHEME
SIOD
Smalltalk
XLisp
XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX: ??.??.??
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN
TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix
newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT: ??.??.??
What is MiNT?
=============
MiNT is a free multitasking operating system extension for TOS. It is somewhat
like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM
program along with a lot of character-based programs simultaneously. MGR
and MW2 can both put multiple terminal windows on screen, and bgacc can
put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go
with it can be found at atari.archive.umich.edu:/atari/mint.

TOSWIN is the new replacement for bgacc: it provides lots of nice features like
variable fonts, menus, selectable window gadgets, etc. GEMTERM is a similar
package (it's not part of the standard MiNT distribution) modelled after TOSWIN
and XTerm.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking
OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now
'MiNT is Now TOS'. :-)

:XWIN: 93.03.01
Is there a version of XWindows for the ST?
==

There actually is a port of XWindows to the ST now, although it is pricey.
Here's the (slightly hacked up) announcement for it:

X/TOS/window/server and X/TOS/window/server/color

Vendor:
X/software Michael Gehret
X/TOS division
Marktstrasse 8
W-8944 Groenenbach
Germany
TEL: +49 8334 1411
FAX: +49 8334 6245
email: xtosinfo@xsoft.uucp
CPU:
Atari Mega ST, STE, TT
68000 to 68040
Memory:
2 Mbytes (4 Mbytes recommended)
Operating System:
TOS 1.4 or higher
Mouse:

Atari mouse
Graphics:
X/TOS/window/server:
monochrome 640x400x1,
monochrome 1280x960x1 (TT, SM194)
X/TOS/window/server/color:
monochrome 640x400x1,
monochrome 1280x960x1 (TT, SM194)
color 320x200x4
color 640x200x2
color 640x480x4
color 320x480x8
Ethernet Card:
Atari Card (Mega or VME bus)
Riebl/Wacker (Mega or VME bus)
Biodata BioNet 100 II (DMA port or VME bus)
Network Software:
Atari/Riebl/Wacker ANS TCP/IP
Biodata TCP/IP
Disk Space:
none (two floppy disks, may load fonts from second disk or font server)
Features:
full X11 Release 5 implementation
Shape, Multi-Buffering, MIT-SUNDRY-NONSTANDARD extensions
PEX extension optional
support of font server protocol
support of X Display Manager Protocol
access control support
compatible to OSF/Motif and OpenLook
high performance (more than 32,000 Xstones on TT)
fast cursor tracking
backing store and save unders support
size of virtual screen limited by memory only, automatic panning
X/TOS/window/server/color supports all video modes at the same time,
including dynamic visuals
loadable key maps (xmodmap format), full support for European keyboard
layouts
3-button mouse emulation with Atari 2-button mouse
may run parallel to GEM (switching with hot key), configurable multi
tasking priorities
about 50 fonts supplied

:DEMOS: ??.??.??
Why won't demo x run on my machine?
==========

90% of the time, if a demo does not run on your American ST, you probably
need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from
atari.archive to allow this.

:PAINT: ??.??.??
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD: 93.06.11
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ZIP, .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu,
jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or
weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP: 93.05.05
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

src.doc.ic.ac.uk

This site has a mirror of atari.archive.umich.edu in /computing/systems/
atari/umich.

:TEX: ??.??.??
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.14) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request
to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The
latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0.
This consists of 8 disks full of TeX stuff, plus an installation program

that takes care of the details for you.

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments,
suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Cross-posted to: comp.sys.atari.st,news.answers,comp.answers

Archive-name: csas-faq/part3

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for compiling most of this FAQ.

Entries are dated by the last change. ??.??.?? means they were last changed before the dates were added.

The following is an index of the questions answered in this part of the FAQ. For easy access to a particular question, search for the tag surrounded by colons (i. e. :GNU:). Questions marked with '*' are new or changed.

Welcome to comp.sys.atari.st
==========

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe, TT, and Falcon. There are also emulators for the Apple Macintosh and IBM PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented. The newsgroup serves as a resource for Atari users ... feel free to contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:MODELS: 93.01.30
All the models in the ST line
==========

This is a pretty complete list of all the ST/TT models and their main features. If you have any additions/correction, of course, send them to me.

Feature key:
CPU's:
8 8 MHz 68000
16 16 MHz 68000
16/3 16 MHz 68030
32/3 32 MHz 68030

RAM:
/1 128kB
/5 512kB
1 1MB
2 2MB
4 4MB
S SIMM slots for expansion

Built-in:
F Floppy
M TV modulator

Extra:
AV 8 bit digital stereo audio, 4096 colors, hardware scrolling, analog joystick ports
MB MegaBus processor-direct bus slots
6U 6U VME bus slots, second serial port
FC Motorola 56000 DSP, 16 bit stereo audio, much enhanced video

TOS:
Highest built-in TOS

Models:
Name CPU RAM TOS B.I. Extra Comment
---
130 ST 8 /1 1.0 M Never marketed
260 ST 8 /5 1.0 M
520 ST 8 /5 1.0 M
520 ST+ 8 1 1.0 M
520 STm 8 /5 1.2 M
520 STfm 8 /5 1.2 FM
1040 ST 8 1 1.0 FM

TT 16/030 Just for developers
TT 32/030 S 3.06 F AV,MB,6U Various mem/HD configs
Falcon 16/030 S 4.?? F AV,FC Many enhancements!

:FALCON: ??.??.??
What are the specs on the Falcon?
==========

Here's some stuff I culled from the (reposted) Delphi conference with Sam Tramiel.

--- Start Quoted material ---
Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.
--- End Quoted Material ---

:ACCEL: ??.??.??
Hardware Accelerators
=====================
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

68000 based: ICD adspeed ST/STe
Fast Tech Turbo T-16 (16MHz)
T-20 (20MHz)
T-25 (25MHz)
68030 based: Gadget by Small SST (16MHz to 40MHz user changeable, 8 SIMM slot
68882 FPU socket, 1 expansion slot, TOS 2.0x).
Fast Tech : Tiny Turbo
Full size version

:TAPE: 93.08.11
Can I use a SCSI tape drive?
============================

Yes, just about any SCSI tape drive should be useable on the ST line. (Of
course, if your computer doesn't already have a SCSI port, you'll need a SCSI
host adapter.) There are at least two freeware/shareware programs that can
help you back up your HD to SCSI tape: TapeBIOS and GEMAR (a German GEM
ARchiver)

:DRIVES: ??.??.??
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:

```
-------------- ----------- ------------ ----------
| MFM drive |------->|ACB 4000 |------>| ICD |------>| ST DMA |
-------------- ----------- ------------ ----------
```

3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put
the drive internally, you will need a case with power supply to house the
adapter and hard drive. IBM case is very easy to get and has a lot of space
for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive
they use about 20 watts or less, Quantum LPS drive use about 10 watts each,
make sure your power supply has more than the drives need. Again if you
use IBM case, the 150 watts power supply for that type case can drive at
least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup
SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL),
it's 50pins IDC female connector on each end with 50 conductors
cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be
available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again.
And check the jumper setting on the drive (consult the drive's manual). If you
are using more than one drive with the system, make sure only the last drive
has the terminator (either a DIP or a signle inline package of resistor, which
usually is socketed and close to the SCSI connector on the drive circle board.
Remove the terminator from other drives. [only the last drive should have the
terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5
from ftp sites.

:FLOPPY: 93.08.11
Can I use 1.44 meg floppy disks and Flopticals?
==========

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe
and TT machines. If you own an older Atari ST, there is a company which offers
a $199 kit (including floppy) to install and use the drive.

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the
desktop.

Floptical drives (floppys that use optical tracking to get 21MB on a 3.5" disk)
can also be used through a SCSI port. ICD's newer host adapter software (the
'PRO' version) will handle them.

:GRAPHIC: ??.??.??
How can I enjoy enhanced graphics on my ST?
==========

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on
older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass
at listing some of them. The information is based on postings by Ben Gilbert
and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different
graphics boards available, from hobbyist to professional, from CAD
to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync
monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Here's a few more cards, available from OverScan GbR, Saentisstrasse 166,
1000 Berlin 48, West Germany, ++49 30 721 94 66, ++49 30 721 56 92 (FAX),
++49 30 727 05 6 (Mailbox, language: German)

Autoswitch OverScan for the ST (NO STE compatibility) is DM 129.--, you
don't have to buy a new monitor. The maximum resolution on a SM 124
is variable, but in most cases at about 732*480.
AutoSwitch OverScan TT is a VME board. It's about 249.-- DM, you also can use
your old monitor, but it only works in the TTs five color modes
(3 ST-compatible modes, 2 TT-modes). Resolutions are variable, ask
OverScan about the values for your monitor.
Falcon ScreenBlaster blows up your Falcons resolution to a maximum of nearly
900*600 on SVGA-monitors. It'll be shipping as soon as Falcon030s

become available, and the pricing will be near 150.-- DM.

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:KEY: 93.09.02
A few keyboard questions
========================

Here's how to connect a MegaST-keyboard to a 1040ST:
It's taken from the "ST-Computer" October '90 ('Quick-Tips')

Picture 1

Mega ST-Keyboard cable
(seen from outside)

```
It's no problem to connect * 1
the MegaST keyboard to the ____________ o
smaller computers 520St and ___| | * 3
1040ST. To do that, you only | 6 * | * 4
have to get a 6-pin western | 5 * | * 5
connector plug to be connec- | 4 * | * 6
ted to the keyboard. (available | 3 * | * 7
in Electronic shops) After that | 2 * | * 8
four cables must be connected | 1 * |
with the 'Pfostereihe' (the |___ | 1040ST
plug inside the 1040ST) where |____________| Keyboard-Plug
normally the dazzy original-keyboard
is plugged in. The exact connection Picture 3
is shown on picture 2 and 3
```

Eickmann Computer, Franktfurt

```
* * * * * * * * * * * * * * * o *
18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 1
```

Picture 2 520 ST Keyboard plug (not for You, Jeff)

Picture 3 (Meg to 1040ST) Picture 2 (Meg to 520ST)
MegST MegST
keyboard cable <--> 1040ST plug keyboard <--> 520ST plug

```
6 <--|----> 8 6 <--|----> 1
| |
5 <--| 5 <--|

4 <-------> 5 4 <-------> 14
3 <-------> 6 3 <-------> 15

2 <--|----> 4 2 <--|----> 13
| |
1 <--| 1 <--|
```

****
And now for No.2
****

If you remove the keyboard from the Mega ST and switch on the computer,
the computer won't boot up and send you a series of 'Alert-Beeps'.
If YOU want to let your Mega ST run without a keyboard (FAX-Server a.s.o.)
simply connect a restistor to the keyboard-plug in the Meg and at once
there's silence and he'll do his job!
(Freely translated from Eickmann-Computer by me)

```
6 * 10kj resistor
5 * _____
4 *----|_____|--
3 * |
2 *-------------+
1 *-------------|
```

Mega ST keyboard-plug
(inside-view)

****
And here's another one: This one's about the Hardcopy-function of the ST's
****

Do you hate it - after pressing <Alternate>+<Help> the same time - when
you don't have a printer connected to the parallel port of your ST and
must wait a long time to work again because of the long break taking the
computer to realize that there's no printer connected?
Well, do this and forget about it:

connect the following pins of the printer port of your computer (better:
create a Sub-D 25pin-male-plug an connect the pins on the soldering side):

pin 13 connected to 14 and 15 (all across the plug)
pin 1 connected to 10
pin 23 connected to 11 and 12

****

:JOY: ??.??.??
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style
joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of
time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable
units"

:MODEM: ??.??.??
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOW to you!

You will probably need a serial port patch program to use high speed modems on your ST; most versions of TOS have a bug in CTS/RTS handling.

:MONITOR: ??.??.??
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM: ??.??.??
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE: ??.??.??
How can I turn my Atari ST into a Macintosh emulator?
==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases. The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and

the excessive use of disk accesses in Mac software will have you wanting a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File Exchange if you are needing MS-DOS data disks for Mac work. Language configuration support, keyboard support, A4 paper size support for Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a MacIntosh with a decent screen is indescribable. The extra flexibility that you get will also make you feel more confident in the greatness of your Atari. You will also get to see some of the frustrations with one of the other sides of the fence - frustrations like excessive disk access, remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating philosophies of an ST and of a MacIntosh. You really must read the documentation that comes with the Spectre GCR (and I for one found that a real delight. Dave and Sandy have a very different approach to software documentation that makes it enjoyable reading.) You should also read the Mac Operating System docs. One other reference you may need if you are going to do much with Mac software is one of the reference manuals referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on a GCR, don't figure you will get a straight answer. They won't know. The current compatibility list from Gadgets lists about 450 programs and their release numbers that have been tried and found to work with Spectre GCR. In general, if a piece of software won't work with the GCR, it is probably becuase of copy protection. Most serious Mac software is not copy protected.

One last note - earlier versions of the emulator exist that were not capable of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64 KB ROM which is not good) to fully utilize the device. Also it's recommanded to use it with MONO monitor and at least 2MB RAM. The Spectre software takes about 300 some KB of memory, so on a 1040 there is not very much left for Mac, especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most Mac drive is double side). With DOS mounter or software like that you can read /write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM binary. It's only for file transfer). Or you can use Apple File Exchange to read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not run with it.

:UPGRADE: ??.??.??
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments, suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for compiling most of this FAQ.

I would like to see such a thing too! I just get frustrated by seeing
all those modplayer interfaces in a useless, scrambled from on my TT
mono display.

While these may work in mono, I think none of them allows for *editing*
of mod files. It's certainly nice to be able to listen to some mods from
time to time, but that's nothing to the fun you can have making mods
yourself. I really miss that since I upgraded to a TT.

To be honest, though most of the information on the Jaguar has been
"sanitized" reports from Atari, I'd be truly surprised if most of it is not
on the up-and-up. As I've said before, one expects a certain level of
hyperbole when a new product from ANY company gets trumpeted, but a
completely fabricated lie about a feature just isn't allowed.

>The
>thing that I'm saying is exactly what I've always said - until we see
>an actual unit, and get some actual specs as opposed to marketing hype,
>we won't know what's inside there.

Yes, but you do seem to be a bit too cynical about it. "I don't care what
the official word is, I ain't trusting them one iota until I see the hardware
myself". I think using the press releases as a starting point and
extrapolating from there (How likely is a feature possible? How many
adjetives were stuck on this sentence?) gives a picture that's probably 95%
accurate.

Perhaps, Michael, there may also be some undue bias against the Jaguar
specifications on your part because you're very hesitant to trust anything
from the Tramiel-operated Atari Corp. No one is completely objective...

>d:\gnu\gnu\lib\gcc_cpp.ttp: Invalid option `-lang-c'
^^^
>--

Sorry, I found what I've done wrong!
The preprocessor and the other 'ttp's were in the /lib directory.
I put them into the /bin directory and unfortunately the old ones
were still in the /lib directory ...

By the way: I had to change the names form gcc-cpp.ttp to
gcc_cpp.ttp (the same thing with the other programs).
Why this?

And I had some problems because the gcc compiler uses filenames
with 9+3 characters for the temporary files (cc10000001.o).
This is not very nice.

BTW: Where can I get the programs 'prgflags' and 'strip' ???

Greetings
Bjoern

My wise friend, I am a MIDI musician too. However, *most* musicians who use computers are only interested in running Cubase or Notator or whatever and don't even use it for WP. This info is based on me running the UK Cubase Club with over 500 members - so I know what I'm talking about. I have not seen any club members in this newsgroup, as far as I know I am the only club member reading this group, but there maybe one or two lurkers. That's out of over 300 ST + Cubase users.

Before you start using your amazingly imaginative language as demostrated above, note the word *most*.

Maybe a completely fabricated lie isn't allowed, but the way that specs are twisted turns my stomach. For example: 3DO publishes that it can move 65MPixels/sec. <The crowd oohs and aahs.> Atari says that the Jaguar can move 850MPixels/sec. <Everyone says, "Wow, the Jaguar kicks the 3DO's ass in raw speed."> But, on further inspection, it appears that 850MPix/sec must be at a bit depth of _1_, given their bus speed, and reasonable memory speed requirements. <drool> What is the pixel depth for the 65MPix/sec of the 3DO? Anyone? If it's higher than 1, we'd have a present day example of where Atari is willing to stretch the truth outrageously to look good for the moment.
To me, that's like saying, "Yes, our car does 0-60 in 3 seconds!" The problem is, they're talking about about 0-60 yards per hour. Silly you, you thought they were talking about miles per hour? Tsk tsk.

I like the saying that some guy on this group told me,
"There are lies, damned lies, and then benchmarks." Ain't that the sad truth?

3590. Need disk formatter program for Supra Drive

Newsgroup: comp.sys.atari.st
Date: 1993-09-05 05:52:13 UTC
From: winters@access.digex.net
Message-ID: <26buqd$8jj@access.digex.net>
Source record: 201453

I just got a Supra Drive Atari Hard Drive (the Drive, power supply, etc... all in a enclosure). I was told that the drive was first purchased in 1986 and after 5 or 6 years it had a disk crash. Since then, when you try to format the drive, the Supra Hard Disk Formatter v2.0 (by Willie Brown, Mark White, 1986 version) comes up with an error "Too many bad sectors to format drive). The guy I got the drive from says that there might only be 5 to 10% bad sectors. Is there any public domain program that I can run on this drive to allow more bad sectors, than the old Supra Formatter allows? The drive is an MFM type of drive (Seagate is the manufacturer). If this route doesn't work, I will get a new disk for the drive - does anyone have any drives of this type for sale? I guess all I have to do is open the case (this sucker is big!!), unscrew the old drive and install the new one - just like a PC! :--)
Thanx for any advice on this...

------ Mike Winters

All this arguing over personalities of Darek and his critics gets no one anywhere. And a list of the shortcomings of the Gemulator compared to a TT or a Falcon also gets you nowhere.
Take the device for what it is and look at how useful it can be.
In one box, former ST owners get their same old machine only twice as fast. And they get a 486 on top. What have the lost? If you don't play games (I don't) or music (I don't) the extra features of the Falcon or TT mean nothing to me. The extra screen resolutions of a SuperVGA etc., system are important. So is the ability to use the best of the old ST software at double speed.
There is nothing in this but pluses. Once upon a time, I bought the ST partly because it could also run IBM software if I needed it (PCDitto) and Mac software if I needed it (GCR). the IBM emulation turned out to be not so good. Awfully slow. But now, a 486 gives you full IBM speed and double the old ST speed. What's the beef? If Dave Small were smart, he would licence GCR technology to Darek and the MSDOS machines would be what I wanted in the first place -- no hassle access to many OS systems, at no speed penalty.
Or maybe Darek and Small should form a joint company.
why are we knocking good ideas? Someone who Already owns a complete system isn't going to buy a whole other one justget a midi port.

Get the ICD utilities. Newer versions allow one to use the software even
if an ICD host adaptor is not present on your system. However, none of the
disk caching stuff is enabled. The formatting and partitioning stuff should
work just fine.

Also, this might convince you to get an ICD host adaptor to replace the
Supra board. ICD stuff is much nicer, IMHO.

I am currently using a Mega ST4 with TOS 1.4. Although I've been using Uniterm I'd like to switch to C-Kermit so that I can use the latest version of the Kermit. C-Kermit uses the vt52 terminal emulation built into TOS. I'd like to know if there is a way to replace this built-in emulation with a better emulation (say vt100) that CKERMIT would access in the say manner it currently does. Would a later version of TOS help?

Thanks in advance.

? dirname (separated and terminated by 0xff)
2 next-header size

encryption header
1 0x20
1 flag (!=0 -> encryption)
2 next-header size

Encryption technique:
---------------------
It is based on eXclusive ORing a variable-length key with the data;
the same technique will recover the original data.
For anyone wishing to add this feature to another archiver, the
following fragment of C code demonstrates the technique used:

char *key; /* ptr to start of variable-length key */
char *keyptr; /* work ptr; NULL if no key */
/*
* crypt - encryption/decryption routine
*/
int crypt(int c) /* c is the CHARACTER to encode */
{
if (keyptr) { /* key supplied ? */
if (!*keyptr) /* at end of key ? */
```

```
keyptr = key; /* yes - reinitialise */
return c^*keyptr++; /* XOR it */
}
return c; /* no key, no change */
}
```

Note that encryption takes place IMMEDIATELY before writing the
archive (i.e. after compression), and decryption takes place
IMMEDIATELY after reading the archive (i.e. before decompression).

```
comment header
1 0x3f
? comments
2 next-header size
```

b. OS dependent (0x40 - 0x7f)

|>
|> Does the Star Raiders II cart work with the Atari800XL?

The game works but is disk-based, not cartridge based. Star Raiders II
sucks anyway compared to the first one, although the graphics are a quantum leap
better :-)

|>
|> Anyway, they should make Star Raiders III more in depth. I LOVE
|> a good first person space epic.. heck, I even loved Star Voyager on the NES.
|>
|> 1) Make the dogfights more Wing-Commanderish.
|> Ya know, lots of
|> chasing, weapon selection, technique, etc. BUT...have obstacles... just
|> like in Space Lords.. gas clouds, Asteroids that don't move that fast
|> etc... (only in some areas.. make some areas less dense, bare, etc.)

ARGHHHHHHH. Nooooooooooooooooooooo! The gameplay of the original is
excellent. If this is going to change that gameplay, DON'T DO IT!

|> 2) Make the bases more detailed. Weapons shops, shipyards,
|> bars, pubs, space fed offices to sign up for missions, army service etc.
|> That way you can go on little missions agains the Zylons etc., transport
|> ships to other areas, invasion missoins on Zylon outposts etc.

AGAIN: NOOOOOOOOOOOOOOOO! That depends on how they do it, but if it's going
to be a 'miscellaneous' role-playing type my answer would be NO!

Maybe they should do TWO Star Raiders. Star Raiders III: The Zylon Imperium and
Star Raiders: The Zylon Civilization or something like that. One is more like
the original and the other is the way you like it.

|> 3) Cinema displays... GOOD cinema displays.

AGAIN: NO! (Except at the very end when you have your rank)

|> 4) A slight RPG element... how about being able to land on planets
|> and explore? Encountering monsters, NPCs, etc.

NO!

|>
|> 5) Have planet missions as well. Kinda like Epic...go down on the
|> planets surface to blow up outposts, aid in Civil wars etc.

NO expcet some basic shoot and fly over planets conquered by Zylons to regain
them back. AT ANY POINT the player shoud have ABSOLUTE control of the spaceship.
No silly 'automatic stuff' unless you have a new autopilot option which could
be screwed up if the computer gets damaged...

|>
|> 6) Make MANY sub-plots so it takes you a LONG TIME to actually
|> crush the Zylon empire.

>>>>>>>>>>>>>>> ABSOLUTELY AND DEFINITIVELY NOT! This means that once you finish
a game, you know what to do. Star Raiders was more like the kind
of game like ottello and chess... a lot of simple rules, any game
could be different.

|> When the game starts... you've been away from
|> the academy (or whatever) and you're looking for various jobs/quests etc.
|> Eventually, you find yourself back in the academy (but you could land in
|> different segments... commando forces, mercaneries, etc.) That way you
|> have a lot of different directions to go in, instead of the standard linear
|> plot.

Hmmmmmmmmmmmmmm.... still NO :-)

|>
|> 7) Have certain areas of uncharted space available through wormholes
|> etc... that way you can pick up alien technology etc. There could be parts
|> of the game where you land on alien planets, possibly friendly. .. that way
|> you could get some bizarre technology... and join in the alien civilization's
|> own plights against enemy forces etc.

This sounds like a very cool idea for the OTHER Star Raiders I suggested
that goes more with want you want. But not for making something like the original!

|>
|> 8) Make different types of star bases, ports, planets, galaxies etc.
|> Each having different characteristics...

Yes.

|>
|> This should all be possible on CD... especially with Jag-PEG and all.

Or make a super-original alike version, wich is possible on cartridge. The original
game was only 8k (kilobytes) wich is just a fraction of the Jag's new cartridge capacity.

Atari was at one time going to produce the CDAR-504, which never did materialize on the market. It supposedly was going to use the ST DMA port, which would have made it compatible. But I do not know of any way to use a CD-ROM unless you have a Falcon, which I have heard allows standard CD-ROM devices.

>You can't "run" programs from either a CD-ROM or a cart; the actual
>control logic needs to be in RAM for either system.

Bogoids. Of course you can run programs from a cartridge. A cartridge
is just a ROM, just like the ROM in your computer that holds your
operating system, or bootstrapping code. I don't know the exact
details of the Jaguar's memory model, but it would be a totally fair
approximation to say that when you reset the machine, the 68030
jumps to a ROM address in the cartridge (either directly caused by
the chip reset, or after running through some tiny initialization
code in some other ROM in the Jag).

>For 95% of the ROM access in your average game, 300Kb/sec is fast
>enough. So you're trading 5% of slower ROM reads against many megs of
>cheap memory.

This is just silly. CD-ROM's are plenty fast enough for stream access,
but absolutely USELESS for random access. For example, what if you
want to have a ROM table of 10000 random monster images, and want to
choose 1000 of them one at a time? On a CD-ROM, you'd be there all
day as the head seeks back and forth. In a cart/ROM, the seek time
is 0.

Having just a CD-ROM for programs severely limits the type of
program that can be made in a limited amount of RAM. The Jag has
2 Megabytes (yes, 16 Megabits) of RAM, which is considered quite
a large amount by console standards. But if you want to start
cluttering that with program code and other randomly accessed
data, you will quickly fill it with even simple programs.

CD-ROM-only console games would be 99% flashy graphics and audio and 1%
gameplay. Maybe today's video game player wants a video game that is
more like a movie (sit back and watch). I doubt it. Those laserdisc
games never really made it.

3612. Reboot-proof RAMdisk for MultiTOS?

Newsgroup: comp.sys.atari.st
Date: 1993-09-06 01:27:07 UTC
From: saj@chinet.chinet.com
Message-ID: <CCws18.6Eu@chinet.chinet.com>
Source record: 201497

Before I got a Falcon, a reboot-resistant RAMdisk was one of my favorite tools. First Mark Williams rdy, then CodeRAM. I never had a variable-sized RAMdisk for the ST, and I would have liked one.

Now I have a Falcon. Under normal TOS I can use rde (although the size limit looks small for the bigger machine). Under MultiTOS I finally have that wonder of the world, a variable-sized RAMdisk! ramfs! Couldn't be easier to use, either. But wait: all is not perfect. Ramfs isn't reset-proof, and I seem to have to reset my machine at least as often as ever.

So is there (CAN there be) a reset-proof RAMdisk for multiTOS? How about a variable-sized one? Best of all, a resizable, reset-proof RAMdisk that works on the Falcon regardless of whether MultiTOS is loaded?

Steve

>Why this?

In your previous posting you wrote:
>export GCCEXEC="${GNULIB}\gcc_"
That is the answer... :-)

>export G++INC="${gnu}\gxx_inc"
Change G++INC to GXXINC.
>export GNUINC="${gnu}\include,${gnu}\gxx_inc"
maybe you better leave this ^^^^^^^^^^^^^^^ out, it is enough to set
GXXINC.
>And I had some problems because the gcc compiler uses filenames
>with 9+3 characters for the temporary files (cc10000001.o).
>This is not very nice.
Well this should not cause any problems as gcc cannot compile more than
one file at the same time under plain TOS. And under MiNT it seems to
use shorter filenames (the version at ftp.uni-muenster.de is linked with
the MiNTLIBs)

From: darekm@microsoft.com (Darek Mihocka)

>DM ... for people who need a more powerful machine. i.e. you buy Calamus SL
and find out your 1040ST doesn't quite have the requirements to run it.
So you need a more powerful machine capable of running ST software.

Calamus SL does run on a 4 meg STE. As far as upgrading, you can:

1) Upgrade your 1040 with 12 meg ram board, and video card.

2)Buy a used Mega STE running at 16Mhz and upgrade the video and ram.

3)Buy an Atari TT for $2000 which will give you 32Mhz processor
speed, 16/256 colour. Add TT fast ram, 24 bit colour card, etc if
required.

All 3 choices use standard Simm chips and standard VGA/SVGA monitors
that would cost the same no matter what platform you bought them for.

You use Calamus SL as an example of "ST"software, but conveniently
fail to mention that it runs on ST/Mega/TT machines!

DM> Yes, the Atari line is a dead end. I've been telling people that for
DM> years!!!! Buying any Atari hardware is a waste of money period. I don't
DM> deny that that's been my opinion of Atari for most of the last 5 years.

ROTFL! On one hand you say Atari is a dead end/waste. Yet doesn't
it clue in that if you have been saying that for years, the platform
still HAS enough support?? Duh! Could it possibly be that those who sign
your paycheck also predetermine your opinions? Oh, of course not!
You have been bought and paid for by Microsoft and now you are preaching
the party line for them!

DM> Gemulator is ... about offering an alternative to Atari hardware that
DM> still allows you to run your Atari software and not have to purchase a
dead end computer.

Yes, it is AN alternative, and yes it does work fine, BUT...If you already
have any Atari software, you have been running it on an Atari of
some kind. So why not just keep the Atari that you have already paid
for, and get a clone, Mac or whatever else-IF your needs dictate this
solution? It's extremely easy to fix an ST/Mega/TT/Falcon -and cheaper
than buying a 386/486 if you don't need one.

DM> ...$200 is a small price to pay to maintain compatibility with
DM> hundreds or thousands of dollars worth of software.

Of course if you have no specific need for a clone, there is the LITTLE matter of the cost of a 386/486. Not quite so cheap.

DM> Gemulator is a nice $200 solution to that problem. Buy the PC and
DM> Gemulator.

Oh, does this mean that u r giving away a PC for FREE with the $200 Gemulator?

DM> ... a market for Gemulator exists.

Yes, it does indeed-but you paint yourself in a very unflattering light when you promote and defend your product by putting down Atari. Anyone who has been around the Atari scene for a while knows of the blatent ineptitude of the Atari management-but we are also keenly aware of your continual pro-DOS/ant-Atari sentiments over the years.

3615. Problems with ST Alladin 1.62 and GEnie

Newsgroup: comp.sys.atari.st
Date: 1993-09-06 02:04:45 UTC
From: ortega@cactus.org
Message-ID: <9309060204.AA00549@cactus.org>
Source record: 201481

Has anyone been having problems lately with ST Alladin 1.62
and GEnie lately?

First, it was getting screwy when trying to login and caused
"INCORRECT FORMAT" to be displayed.

Now, it doesn't upload mail or new messages properly.

Is it worth it to even bother with GEnie anymore?
I'm thinking real seriously about giving it the heave-ho....

3616. Write Protect detection

Newsgroup: comp.sys.atari.st
Date: 1993-09-06 02:34:09 UTC
From: jwilson1@alsvid.une.edu.au
Message-ID: <CCwv4y.2Mz@alsvid.une.edu.au>
Source record: 201599

Has anyone had problems with the Write Protect detection on their ST's?

We have an old (5 years, maybe) 1040 STFM here and after using it for a while the Write Protect status thingo (on the disk drive) will change for no apparent reason.

For example, I was formatting a disk and half way through it said the disk was write protected and the disk couldn't be formatted.

Hopefully I will find the contacts are just dirty or something when I open it up, but has anyone had this problem before?

Thanks

>***

Yeah, Warhead is a GREAT game. When I first got it, my friend and I played
it everyday until we finally solved it. Then, last year, I booted it up
again and decided to finish it once again from the start. The games remains
interesting and fun to play and even now I have an urge to boot it up
and play. :)

The Berzerker is one BUFF space alien. When you first meet him, you go
through the simple task of getting information on him. The next (few?) times
you encounter him, you're there to test his strengths (and weaknesses).
One thing that you have to do is identify his weapons (the pseudo-stellar
missile? or something like that) and notice that the Berzerker doesn't travel
very fast.

To defeat the Berzerker, you must make your last stand at Jupiter(? or maybe it
was Mars) when he enters the SolBase Star System. What you have to do here,
is to ANNOY the Berzerker so MUCH that he gets pissed off at YOU alone. To
annoy him, you almost HAVE to HIT him with everything you have. It seems
like every single mine has to detonate and hit him, as well as all your
missiles. He will send you a message telling you this and will begin to chase
only you. This is when you WARP to the galaxy with the Black Hole. Once you
get there, immediately run away from the black hole. THe Berzerker will follow
you here only to get sucked into the black hole because of his slow speed.
Once he gets sucked in (and it'll tell you he has) go back to SolBase.
Sometimes you have to repeat this in order to get the Berzerker sucked in
because the Berzerker sometimes warps into the area far away from the black
hole and you get sucked in first. If you fail and he goes past the planet, the
game has already ended. SolBase will be destroyed and you will be defeated.

Hope this helps.

3619. Favorite Term Software?

Newsgroup: comp.sys.atari.st
Date: 1993-09-06 04:29:56 UTC
From: cj195@cleveland.Freenet.Edu
Message-ID: <26eec5$49s@usenet.INS.CWRU.Edu>
Source record: 201593

What is your favorite terminal software for the ST and why? I have searched the FAQ for this information, and I don't believe it's there. I only know two programs, Interlink from Intersect and Stalker. I have serious problems with each of them, but I prefer Interlink.

Interlink doesn't include zmodem as an integrated function but must call a third party shareware program that I downloaded from the Intersect BBS. This zmodem program does not provide for choosing between binary and ascii transfers. Everything is binary. Therefore, I have to boot my STalker every time I want to download ascii files from the VAX that gives me my Internet access. For everything but zmodem ascii downloads I prefer Interlink because it is faster, less buggy and does a better vt100 terminal emulation. Also, I love the ease with which I can make ascii files on floppy by saving the capture buffer. I have never learned how to do this with STalker.

STalker has a much nicer dialer than Interlink and setup is much easier. But my copy lets me down from time to time; and when I'm logged onto the VAX, I often have to use <shift><clear home> to see my $ prompt. It is a terrible annoyance. The zmodem works great though, and I would be lost without it.

Surely there are better term programs than either of these for the ST? What is your favorite? Why do you like it? What do you dislike about it? If you send me email, I'll post a summary.

Hi,

> I'd like to write routines to generate postcript files.
> I don't want to print them but only to check the
> result for debugging. So I just need a program as
> ghostview : is ST version good ?

Before you write any code, here is an excerpt of an article I saved
from somewhere:

=GNU has a set of graphics utilities available via anonymous ftp from
=qed.rice.edu as /pub/graphics.tar.Z. Along with replacements for the
=Unix utilities plot and graph, it contains a very good postscript
=library in C to draw circles, lines, text, dots, etc., etc. As a
=bonus, any PS file generated with these utilities is editable with
=idraw!

As far as ghostscript goes, there is currently no ghostview for the ST.
Someone was working on one (MiNT only), but the last email message I
sent to him went unanswered, so I am unsure of the status. You can just
use ghostscript by itself or with the gem shell that I wrote. Both are
available on atari.archive (Gnustuff/Tos/Ghostscript). It is not too
bad, although startup is a little slow. You should also be aware that
the GS fonts are deficient.

GS 2.61 will handle windows and color a little better. It will be
a full GEM application.

>
> Ken

Atari has wisely decide not put out their own labeled CD-ROM drive due to the fact that it will cost them more to do so. As for ST, yes the good old ST, one can easily add a CD-ROM drive. All there required is your ST has SCSI adapter card like ICD's so the ST has SCSI acess. So most SCSI interfaced CD-ROM drive should work. I have tested with Toshiba's 3301 without any problem. The needed software driver is included in ICD's software. The Atari's Metados2 doesn't work too well, ICD has modified it a little and still call it Metados2 is what I have used and worked in the very first trial.
The CDAR-504 used the Chino (maybe spelled wrong) SCSI CD-ROM drive.
However, currently there is no ATARI specific CD-ROM to take advantage of.
There was some disscusion a few months ago about this, someone supposely are working with Walnutcreek to put atari.archive.umich.edu's collection into one CD-ROM, also Atari supposely is working on the long awaited Developer CD-ROM.
(None of them has show up yet, any one has definit date on those?)
Tang
sytang@lamar.colostate.edu

P.S> There is a program also availible for playing the music CD on the CD-ROM drive connected to ST.

> or case-sensitivity?

MultiTOS supports loadable filesystems, and such filesystems can
implement these features. The standard filesystem is still GEMDOS
with all its limitations, but minixfs seems to be a very good
alternative with regard to your requirements; check out the current
version at atari.archive.umich.edu.

Source record: 201485

I've got an HPDeskjet 500 that can print from my ST via
Spectre (3.0) or from a Mac...with software from GDT called
JetLink Express.

When I print from the Mac, using the serial cable provided and
the speed set at the recommended 19200 baud, the printing
seems much quicker than from the ST/Spectre setup. When I use
9600 baud on the Mac, it is harder to tell if this is the
same/faster/slower than the ST. Does anybody know what the
ST/Spectre setup does (in terms of speed) when sending data to
the printer?

Just thought I'd ask.

I would be interested, too. Please post away.

You get by the Space Worm by luring it in the Black Hole You've encountered earlier.
Since it has only an acceleration of 1 g, it can't get out, deceasing with the message
Oh' erthworm, You've slained me... (klick).
Message might be different, but context is the same.
Of course, first you have to get that beast to follow you (and not the earthlings).
Otherwise the earth will be its primary goal and then...
Simply fire everything You have, including You exploration drones and machine-guns
at it every time You encounter it. Sooner or later it follows You, and when Your
commanders realize this, they volunteer You for a mission to get rid of that thing
anywhere You like. Anywhere but the earth. See you in a better life...
Needless to say, that choosing any other location than the black hole and
not coming straight back after that will result in Your "No-Proper-Use
of-the-Hyperdrive-so-youre-fired". Kinda stupid, when the mission says anywhere
you like.

Ciao, Dirk

| I wrote:

| >the CD will become the media of the future and will replace cartridges within
| >a few years. They're cheap,...
| >... that games for the CD32 are half the price,

| Ridiculous. Raw materials is not the deciding factor in game prices. What
| percentage of $50 do you think is the plastic case and the ROM chip? If
| you can make a CD for $2 and a ROM chip for $10 doesn't mean you sell CDROM
| at five times or twice or even $8 less than ROM.

CDs are cheaper to manufacture than cartridges. Period. The only thing
expensive about making CDs is the glass master etc. Cost of pressing
additional CDs is practically zero. Cartridges include plastic, a PCB
and an IC.

But this has nothing to do with the prices of the CD32 and the Jaguar.
I've seen both and games for the CD32 are half the price of those for
the Jaguar. It will take about 5 to 6 games and you have the initial
price difference made away.

| Besides, you can't run programs off a CDROM. They have to go into RAM
| first. The Jag has a 14Mbyte ROM, 2Mbyte RAM. Would you want valuable
| RAM taken up by read-only code and run-time data copied off a CDROM or
| taken up by 720x576 32 bit colour graphics?

Oh, yeah. You get real-time graphics out of a ROM, right. Sure. One
thing about ROM is that it's *slow*, compared to RAM. Or you would
want to have real fast ROMs, but they wouldn't be cheap anymore,
remember? See your previous point. You don't even want to run code
out of the ROM. It's just too slow. On the Amigas with MMUs, it's
common practise to copy your ROM into Fast RAM for speed.

Peter.

| >You can't "run" programs from either a CD-ROM or a cart; the actual
| >control logic needs to be in RAM for either system.

| Bogoids. Of course you can run programs from a cartridge. A cartridge
| is just a ROM, just like the ROM in your computer that holds your
| operating system, or bootstrapping code. I don't know the exact
| details of the Jaguar's memory model, but it would be a totally fair
| approximation to say that when you reset the machine, the 68030
| jumps to a ROM address in the cartridge (either directly caused by
| the chip reset, or after running through some tiny initialization
| code in some other ROM in the Jag).

Make that an 68000. But you don't want to run programs off a ROM, when
you have an 68000 faster than 8 Mhz. The Jaguar has a 13,3 Mhz 68000.
ROM is slow. If you really want speed, you'll end up with your RAM.

| >For 95% of the ROM access in your average game, 300Kb/sec is fast
| >enough. So you're trading 5% of slower ROM reads against many megs of
| >cheap memory.

| This is just silly. CD-ROM's are plenty fast enough for stream access,
| but absolutely USELESS for random access. For example, what if you
| want to have a ROM table of 10000 random monster images, and want to
| choose 1000 of them one at a time? On a CD-ROM, you'd be there all
| day as the head seeks back and forth. In a cart/ROM, the seek time
| is 0.

I call 1000 out of 10000 monsters silly. Your example doesn't reflect
reality. Furthermore, you can't put 10000 monsters in your 14 Mb
cartridge and the load time still would be far more than 0.

| Having just a CD-ROM for programs severely limits the type of
| program that can be made in a limited amount of RAM. The Jag has
| 2 Megabytes (yes, 16 Megabits) of RAM, which is considered quite
| a large amount by console standards. But if you want to start
| cluttering that with program code and other randomly accessed
| data, you will quickly fill it with even simple programs.

Look at it this way. The Jaguar has a cartridge of 14 Mb, which
has to take *everything*, all code, all data, sound, graphics.
It has to have the code to access the hardware.
The CD32 has 1 Mb ROM, with an operating system that kicks many
OS's of today down the drain and does pretty neat animation.
The CD is free for huge levels, huge graphics and you can play 16
bit music while playing. See what they do with 1 Mb RAM on an
Amiga today, so 2 Mb is even better.

> CD-ROM-only console games would be 99% flashy graphics and audio and 1%
> gameplay. Maybe today's video game player wants a video game that is
> more like a movie (sit back and watch). I doubt it. Those laserdisc
> games never really made it.

Nonsense. You can add flashy movie sequences, but you don't make
a game with that. People aren't stupid. You'll see all Amiga bestsellers
on the CD32, but then with better graphics and sound.

Peter.

I have this happen to me once in a while (I have a 520ST with 1 meg and TOS 1.4) and I clean it up by cleaning my disks with a virus checker. It hasn't happened in about a year now, but when I was booting from a floppy, it would periodically happen. Now that I boot from a HD it has never happened.

Go figure.

In an effort to speed up my boot disk, I've been trying to pack executables, but seem to be having trouble with accessories. I've tried both Ivory Dragon and Pack Ice - both lead to bombs.

Is it possible to pack acc's ? Are there any packers that are more reliable at this ? Have I juts been unlucky in the accs I've tried so far ?

Any info would be much appreciated.

The CDAR was available in Germany...

Seriously, you can hook any SCSI type CD-ROM to an ACSI->SCSI adaptor (ICD and others), use MetaDOS 2.0 (freely available) and there you go with your ST.

bye, Peter

>expensive about making CDs is the glass master etc. Cost of pressing
>additional CDs is practically zero. Cartridges include plastic, a PCB
>and an IC.
>

If CDs are cheap to produce, then why are the CDs you buy in
record stores priced from $10-$16, where a cassette is about $5-$9?
Please dont start spouting stuff like 'royalties' and etc,
and thats garbage, royalties and etc would be the same for a cassette
or a CD.
Also please dont point out any difference in the CD you play
music on and a CD you play a game on, as the same basic technology
applies.

Fact is, even if the production is cheaper, that does not
reflect on the consumer price.

magi.(some archive name) is available from most FTP sites, and lets you do things like alter the 68030's clock speed, switch caches on and off etc....

Personally I prefer Backward, which has got a nice GEM interface, a wider range of options, and means you don't have to fiddle around with boot disks. Currently available from a FTP site near you, atari.archive is probably best.

Try in the Falcon directory, under the name backwv13.lzh.

Compatibility-wise, I haven't tried it with many demos, but lot's of games work (well, about 80% of the few games I've tried work, probably more would work if i fiddled with the options a bit more) Speedball II, elite, f19, what more do you need..?

John.

```

If you look into the drive, at the front left, are usually 2 prongs (except on the rare light-sensing units), these can occassionally stick, the right one is the disk-detect, the left one is the write-status detect. If there's nothing wrong with them, then you'll need to remove the disk drive, and check the circuit connections (mine stuffed up a while back, but I re-soldered it and it's been fine ever since!), I'm not sure why this happens apart from the possibility of the disks dropping down onto it might knock things around a bit, and eventually dis-lodge something!

> If CDs are cheap to produce, then why are the CDs you buy in
>record stores priced from $10-$16, where a cassette is about $5-$9?

Because 1) CD's are a superior product in virtually every way, and 2) that's about as cheap as you can sell a cassette. The industry knows that CD's must be more than cassettes for the cassette market to survive, and they do want that market to survive for as long as possible (modulo Sony and Phillips' attempts to steal this market with MiniDisc and DCC). Besides, lots of people will pay $14 for a CD now, and (of course) the music biz has a kind of trust going here -- no one's willing to dip below the current price barrier -- for "pop" music at least -- and break the trust. (Clearly they feel that it's not worth the market share they'd gain to do so.) There are plenty of classical CD's out there selling for $4 to $7. And you can get cut-outs of rock, etc. for $3 to $7 at places like Kemp Mill Records and The Wiz. So it's clearly not a cost-of-media issue that's keeping CD prices up.

CD games may not be cheaper for the consumer, but they're definitely cheaper for the developer, which may mean that developers will prefer to make CD games rather than cartridge games.

Specifically, cartridge games require a huge investment. You can't make a small run (5,000) of carts; it's not cost-effective. But you can have CD's pressed for around a buck a disk even in lots of 500. This is factor of 10 to 20 difference. Think about how rare cart manufacturers are when compared to CD pressing studios. Since the CD's are used for billions of dollars of music, companies that press CD's are quite common, as is the equipment to do so at home. (E.g., Phillips has a CD mastering machine that's $4,999 street price.) This is all just economies of scale.

Many small companies will be able to make CD games that could never have raised the capital to make cart games. How much impact this will have on the Jaguar/3DO situation is anyone's guess.

So it may be true that CD game makers *won't* pass the savings on to YOU the consumer, but they *could*, and this is a good situation for them. A cart game maker, however, has no such option. They *must* charge in the $30+ range to cover costs.

I am looking for a couple of things. maybe someone, somewhere has
them available. (I look -- longingly -- through the articles.)

First off, I *really* need a larger hard disk. Mine is totally
maxed at 40mg. I also need a c-compiler.

Does anyone have these things for sale, trade or ???

3648. WANTED: Falcon owner to beta-test game software.

Newsgroup: comp.sys.atari.st
Date: 1993-09-07 00:14:51 UTC
From: warwick@cs.uq.oz.au
Message-ID: <15279@uqcspe.cs.uq.oz.au>
Source record: 201608

I am looking for a Falcon owner who can test small programs written
using my AMS C++ game library. You don't need a compiler or anything.
There will be lots of small programs to just run, and tell me whether
or not they work. That's all.

My aim is to increase the Falcon support in AMS.

As a first task, I'd like to support Falcon graphics resolutions.

At the moment, AMS supports ST and TT resolutions, but can VERY easily
be adapted to use Falcon resolutions as well. So the first few test
programs will just put the Falcon into various graphics modes and
draw some boring sprite on the screen.

About AMS:

The AMS library is a collection of C++ classes and functions that
gives access to many features of the Atari computers sytems that
are not normally found in general-purpose C++ libraries.

The Atari Machine Specific Library is free and protected under the
GNU Library General Public License.

You are free to copy and modify the sources, provided you acknowledge
the origin by retaining this notice, and adhere to the conditions
described in the GNU LGPL.

ie. It is a freeware C++ game programming library.

Some of the programs will no doubt crash, and I've no idea what is
"safe" as far as monitors are concerned, and I hope you can trust me
not to send a virus.

Any takers?

I can see his point; knowing the Tramiels, the Jaguar probably has an
8-bit bus between the main processor (whatever it is; TOM or the 68k)
and main RAM. Or maybe the 64-bit bus actually runs at about 4Mhz to
wait for some really slow chips they've used to cut costs.

Well, actually, it was the version before the current version that we
were talking about; and I was mentioning that no matter what I do, and
no matter what ACCs I use, I can't load more than one ACC with MiNT
active on my system. It's a pain! I'd like to have TOSWIN going and
the Before Dawn ACC (on my system, Before Dawn never did anything
without the ACC loaded), since it's so cool...

If they'd had a chance, there would've already been Falcon040 and more
powerful Falcon030 machines announced.

Does anyone besides me remember the Falcon040 'scam'? How, the summer
of the Falcon030's 'release' (since it didn't show up 'til Nov/Dec of
last year), some hardware engineer-types with "Falcon040 development for
Atari Computers" on their resume's showed up? We were all so hopeful
that soon (Real Soon Now! Really!) there would be a more powerful
Falcon030, and gee, even an 040 machine, since the Falcon030 is too
wimpy for most of the heavy-duty hacking many of us like to do... not to
mention all of the other (and there are quite a few of them) highly
valid complaints that we've had about the Falcon030.

Atari Computer is doomed; the Jaguar might be a success, but they'll
never release another computer.

Minidisc isn't appropriate for code since it uses a lossy compression;
might be good for video though, and it's definitely fine for sound.

> or case-sensitivity?

Short answer:

Nope.

Long answer:

MultiTOS is a multitasking AES (the graphical user interface of Atari computers) running on top of MiNT, a multitasking kernel that handles all of the low-level stuff.

MiNT lets you use loadable filesystems, so you're not stuck with the idiot DOS filesystem that the Atari computers use. One of the most popular filesystems is the Minix filesystem, which lets you use longer filenames (I think the limit is about 15 or 20 characters), with as many dots as you want, and upper/lower-case letters. The minixfs is also MUCH faster than the crummy DOS filesystem (aka a 'FAT' system).

> then the system was "dead".

i found "my error". in PureC you must put the -P option (absolute calls)
in the .prj-file. unfortunately the compiler doesn't give a message. so i thought
that everything is ok.
now my Mint 1.08 is working correctly.

by the way, has someone an aes falcon-version>4.00. it would be nice if you could
mail me this. i'm also looking for the cpx-tools to config. the mint, because i got
an "old" falcon (4m ram, 65 mb hd, without mint and speedo).

thanks

How did you get F19 to work? I've tried all sorts of configurations on my
Falcon, which get varying degrees of success, but the game itself always
crashes. I'd be very grateful if you could tell me the exact configuration of
options you used to get it to go.

Cheers

Marshall, you might try a little utility by Double Click Software called
DC Mouser. It allows you to hide/show the mouse cursor in the event that
it gets turned off when it's not supposed to or vice versa. Flash will
do this when executing GEM programs, so you need the mouse pointer turned
on. With DC Mouser, all you have to do is press S-C-Up (show) or S-C-Dn
(hide). You should be able to find DC Mouser on an FTP archive fairly
easily.

3664. LHarc2.22 Archive-bit

Newsgroup: comp.sys.atari.st
Date: 1993-09-07 08:36:58 UTC
From: mk@musik.auc.dk
Message-ID: <1993Sep7.083658.15470@vaxc.aud.auc.dk>
Source record: 201623

Trying to use the LHarc 2.22 workfiles that are to be transported from home -> work and vice versa I find myself confronted with a very annoying problem:
The selection of the files that are to be transported make use of the archive-bit-option `/ryb` and it works alright (the archive bit of the original files on the deliver-machine is set to OFF) but when unpacking the files again the archive-bit is ON on the reciever-machine, causing the same files to be transported back again later for absolutely no reason at all!
I have tried to take advantage of the various `/I` options but they don t seem to function - actually there is a discrepancy between the german-docs and the english-translation, the first claiming that they will be ignored the other that they will be reset.
Has anybody any suggestions, corrections or good ideas that will solve this `luxury-problem`?

I hope you don't think CD-I is a good example. They can't GIVE their stuff
away. None of their CD's are worth $40 anyhow.

Anyhow, I read in one of the latest videogame magazines (take it for what it's
worth) that initial 3DO releases are expected to be priced similar to SNES
games.

>>You also have to realize that CD games generally take longer to develop, unless

I don't think it is possible, because of the way ACCs are loaded. For instance, the AES does the Mshrink() for you before jmp'ing into your code. Accessories are *not* programs, although they have the same header.

Of course if you ran MTOS you could autoload packed applications onto the Desk menu, which might achieve the same effect.

Hi!

I would like to know if there is an Atari ST version of C-KERMIT.

Is there?
And where to get?

Thanks for any pointer ... eMail, please ...

Best wishes, Mathias

The lossy compression algorithm Sony uses for sound MDs (ATRAC) produces an almost
5-1 compression ratio; I believe the 74 minute (actually 74:59) Minidiscs store
about 128 MB uncompressed data (of course we can only access it compressed).

Sony has announced MD-Data, an almost identical system with slightly better
reliability but no compression, to hit the market next year. Unfortunately,
Data MDs will not be compatible (neither the record/play unit nor the actual
media). The data MD units will have transfer rates in the 175K bps range, much
faster than the current sound MD units (since they only need to load/save about
1/4 the data of a CD given their compression and read ahead).

For a list price of around $700, the MD-Data recorder/player will be an excellent
medium for certain types of data storage; the MD-Data discs themselves will
probably sell for a bit more than their audio counterparts.

If only Sony could have done this all in one unit with some switchover logic to
determine whether to use compression or not, I'd have been extremely pleased.

As it is, they have two distinct products which will probably hit their own
market niches fairly well.

After a private discussion with Patrice we wonder whether the following
should be possible: write a small TSR that installs a shell_p routine
which simply Pexecs "/bin/sh" (or according to an environment variable,
the default shell). Then you'd be able to call your shell even when PC
was started from the desktop.

>Minidisc isn't appropriate for code since it uses a lossy compression;
>might be good for video though, and it's definitely fine for sound.

Minidisc is _perfectly_ appropriate for code, since without using any
compression at all it can hold 140 Megabytes of data (unformatted capacity).
That 'aint chickenfeed in anybody's language.

Given the data transfer speed limitations of the MD, and current average
computer technology, would it be advantageous in terms of performance to
store all data on disk in a non-lossy compressed form such as that used
by Stacker on the IBM PC contemptible? This could, with a reasonably fast
processor, give speed advantages - loading a smaller amount of data and
decompressing vs. loading a large amount of data.

Thoughts on this anyone?

Given that all audio MDs use the ATRAC sound compression system, it would
be expected that computer MD drives would also have the hardware to perform
this compression/decompression built in. One might expect, therefore, a new
computer audio standard to develop, with sample files being saved in ATRAC
format (with a 4:1 compression ratio), for a small loss of sound quality.
Hopefully the compression could be done invisibly to the computer using
the drive.

You could supply just about any software release on one MD. (Well, any
software release that you could fit on 80 HD floppies anyway!). I hope
MD takes off as an audio format, since this would result in _cheap_
media prices, and thusly the first real random access, high capacity,
rewritable _replaceable_ mass storage media for your average computer
user on the street.

If they can get out a computer MD drive in the 300 to 400 pound range I would
definitely buy one. It would have a storage:cost ratio that would be unequalled
by any other competing rewritable media on the market, and could rapidly
become _the_ new standard. I really hope they establish MD firmly - it
would make today's floppy disks completely obsolete.

Cheers

In article <H.eg.NP&KrEpuCss@semprini.tdkcs.waterloo.on.ca>,
cherborth@semprini.tdkcs.waterloo.on.ca (Chris Herborth) writes:
}
} MiNT lets you use loadable filesystems, so you're not stuck with the
} idiot DOS filesystem that the Atari computers use. One of the most
} popular filesystems is the Minix filesystem, which lets you use longer
} filenames (I think the limit is about 15 or 20 characters), with as many
} dots as you want, and upper/lower-case letters. The minixfs is also
} MUCH faster than the crummy DOS filesystem (aka a 'FAT' system).

The filename limit is completely dependent on how you 'minit' your
disk. The command goes something like:

minit -Z -V -n x D:\

where -Z is one of the protections vs TOS, -V means a level 2 fs, and
-n <x> says how long the filenames may be. The 'x' is a number between
1 and 16, and you get (x*16 -2) length filenames. So the longest
filename is 254 characters.

Simon.

Care to put something behind this one? Have to be a bit of a time frame; I'll give you that much. How about this: if Atari releases a new computer (and I include a Falcon in a different case as a new computer--plenty of people care about that) before January 1, 1995, you'll stand me to 2 nights in a decent hotel and a good dinner at whatever the nearest interesting place to you is (and a guest, if I can lure someone along). If it hasn't happened by then, I'll do the same for you, at the nearest interesting place to me.

From: PETERC@v2.ph.man.ac.uk
Message-ID: <1993Sep7.154056.14782@nessie.mcc.ac.uk>
Source record: 201642

Hello all,

Having owned an ST for 6 and 1/2 years, I've finally decided to
use it properly, that is with a CLI.

So I got gulam from the archives. Since I am used to several editors
on various systems, I decided to change some of the key-bindings
in the 'ue' regular buffer.

Problem is that the key bindings don't seem to stick at all
and also there seems to be a limit on the number you can specify.

What I want is a batch file which I can run to change the bindings
when I boot up and run 'gu'.

For example, in the gulam.g file

```
# stuff to set PATH etc

# then key bindings
kb -r 082 3e
# etc
```

BTW, I have a 520STfm with an upgraded internal floppy drive.

So, is there a bug and hence a patch?
Or even better, is the source around which I could hack.

Thanks in advance,

Peter - peterc@v2.ph.man.ac.uk

>>
>
>I thought so myself until I saw a Falcon that has been modified with a 33MHz
>030. The results were only 20% faster, not very impressive.

Probably due to inadequate design. I'm not knowledgable about the
Falcon architecture, but having a CPU at 33MHz does not mean that
everything is capable of handling that speed. If the bus and
peripherals are not designed to handle a 33MHz clock, then the CPU has
to wait (wasted cycles) if any bus i/o is needed.

Of course, I can be totally wrong. Somebody w/more knowledge of the
Falcon architecture can give a reason for the small increase in
performance with a 33MHz CPU.

Well, I won't get into the argument about which is "better", HiSoft or GFA,
but two facts remain...

1) GFA is more widely used than HiSoft,
2) I doubt _seriously_ if HiSoft would be interested in an optimizing
compiler for GFA. :)

HiSoft's big ace-in-the-hole is that their new version is to be totally Falcon
and MultiTOS compatible while GFA is still squabbling about legal issues with
Richter. HiSoft makes a fine product, no doubt, but it's tough to learn a new
way of doing things, even if it might be better. Ain't it always? :)

Okay okay...so you didn't like my ideas about Star Raiders II..BUT.

I LOVED the original...but don't you think the space battles would
be better if they were more detailed? Keep the weapons selection, shields,
warps, but make the flying more 'realistic' as in Wing Commaner or Epic.
Free flight.... loops, kick outs (or whatever they're called) ... Keep the
frantic action of Star Raiders intact...but just make the graphics better,
different aliens with different ships... battle tactics... customary procedures
etc. etc... I'd like to see Space Lords type battles.....

I'm not saying make the whole game RPG...but when you land on a planet,
starbase, etc. and get out of the ship... how about making your character
visible in a tilted perspective (la the fight scenes in the old SSI Gold
Box games...but yet more detailed)...where he/she could walk around, go
into shops... meet new NPCs with different abilities etc. But I wouldn not
make the RPG element (I HATE them!) a major part of the game... just a way
of finding out information, getting supplies etc.

I meant free-flight planet battles. In Epic, when you go on a planet
you have free reign over the terrain. You can fly anywhere... and there
are land-based and air-based enemies all over the place. What's wrong
with this? Staring at the barren vastness of space can get boring... how
about zooming through a giant starbase's exhaust port (like that awesome
sequence in StarFox).

What's the matter with a lot of cinema displays? When you die,
when you blow up a major ship or target... when you find some important
character etc.... and when you win. Also for docking, taking off etc.

Sorry to jump in 'Flip', but this shows the Big Flop the Falcon
is. I hope ATARI has enough $$ to push the Jaguar because it looks
like a cool machine. :-|

Ah, well, C= is approaching to a degree the same situation.

To those that think of upcoming Falcon models, think of it no more,
as ATARI has impliedly said they are going videogames only for quite
a while.

[stuff deleted]

No flame guys (except to those who deserve it :-)), but we need
reality to check every now and then. I would like to see the Jaguar
out and selling. (Well, same with CD-32 :-))

>

With a VGA it can do 320*240 or 320*480, with an RGB it can do 640*400
interlaced or a little more in Overscan mode.
All modes can be extended with additional hardware.
These figures apply to True Colour mode ONLY.

Really? I guess you did not read early advertised "specs" for the Atari
ST computer line then. Atari got away with out-and-out lies about their
system, and they printed more lies when they compared the ST's
capabilities to the Amiga's. I am not saying that Atari has lied this
time (although I suspect it strongly given that they list screen
resolutions not attainable with NTSC), but also that there is little to
prevent them from making things up in their press releases. They can
always claim at a later date that it was a "typo" or that the system
changed just before release if they get called on any of their claims
anyway.

CDs are more expensive because that's the way record companies like it. In
the UK it has been under discussion in Parliament, but I don't know what the
outcome was.
This has absolutely nothing to do with computer CDs.

Here is the info that I received about Straight Fax 2.0 which is due out from Toad Software. Unfortunately, all I have is phone numbers, but you can call them for further info...

Toad Computers is currently testing a Class I implementation of Straight Fax. It will be available as a upgrade. My understanding is that they have some literature prepared on the new product. Their numbers are:

(800)448-TOAD
(410)544-6943

Commodore, under Jack Tramiel, also lied about there being a CP/M emulator for the Commodore 64 computer. When people bought the system because of this, only to find there WAS no CP/M emulator because it had never been finished, the (FTC?) forced them to make good on their claims and actually produce the emulator. Not many were ever made, but they did have to live up to what they said.

Also... the Jaguar has an RGB output capability, so those "non NTSC" resolutions might be available if the system detects a color monitor is attached...

Hmm... so if there are 4000 Falcons a month being shipped, why aren't we drowning in people with new Falcons..?

Dealers around the US at any rate sold out of their first shipments right away of course, but their experience since then has been either waiting for more, or watching the stock they did get sitting on the shelf.

The 5000 units sold figure came from Ron Luks, the manager of the Atari Forums on CompuServe.. with his contacts in the Atari world, I think he's a reliable source.

Here's an experiment everyone at home can do... go to your "local" Atari dealer, and ask THEM how many Falcons they've sold.. (dealers are a lot more likely to talk about it than Atari anyway). Then we can add up all the numbers.

As if it matters anyway... Atari has turned its attention to the Jaguar.

Atari has said that the reason they went with the 16Mhz bus is that the rest of the chipset was designed for that speed. If that's the case, then simply speeding up the CPU is likely to achieve only modest improvements as noted...

Sort of like tacking a 16Mhz CPU onto the 8Mhz ST...

It's Because people don't know that it costs less to make a CD than a cassette, and since a CD sounds better than tape, people think that's why CD's cost more.

I think it's a big scam, but I have no idea on how to make a change!

Without FastRAM, the Falcon configuration (030 on 16-bit bus to RAM
which is accessed by video via other 32-bit bus) is obviously a good
tradeoff. With FastRAM, you should see performance increase in good
proportion to CPU speed (assuming you copy ROM into FastRAM).

Take a Falcon and throw out the parts most people don't need, and you've
still got a machine too slow to drive its own graphics.

Doesn't that suggest that maybe the 16-bit bus is more of a liability than
Atari would like us to think?

3709. UPLOADED: MasterBrowse 2.8a (atari.archive)

Newsgroup: comp.sys.atari.st
Date: 1993-09-08 07:01:58 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.Pxk0cBEiqsU@elfhaven.ersys.edmonton.ab.ca>
Source record: 201440

September 8, 1993

M a s t e r B r o w s e 2 . 8 a
"""""""""""""""""""""""""""""""""

Copyright 1993, Michel Forget
Electric Storm Software

There is a new version of MasterBrowse available!

The file (mb28abin.zoo) has been sent to atari.archive.umich.edu
(and will be available as soon as the archive maintainers process it).
In addition, the file will also be uploaded to ftp.cs.tu-berlin.de and
ftp.tu-clausthal.de over the next few days.

For those who have never used MasterBrowse before, a detailed description
of the program will follow this list of new features and bug fixes:

[NOTE: The new features and bug fixes for this version are listed BEFORE
the new features and bug fixes for the previous version.]

~ ~

MasterBrowse 2.8a (September 8, 1993)

o A problem with the variable movement base was fixed; if the new
position would be before the start of the document, or after the end
of the document, then only the scroll bar would be moved.

o The "Escape" key is no longer used by MasterBrowse.

o The "Save Positions" option now operates slightly differently. If it
is highlighted, MasterBrowse will save the positions of the first
seven windows. In addition, it will open the first seven windows in
the saved positions. If it is NOT HIGHLIGHTED, MasterBrowse will not
use the saved window positions (or save them if they change). When a
document is opened, the window will be sized to fit the document. The
title of this option is now "Save/Use Positions".

o MasterBrowse can now use "ClrHome" to move to the top of the current
document, and "Shift + ClrHome" to move to the bottom of the current
document. You can, of course, still use the other methods.

o MasterBrowse now supports colour! You can set the colour of the text
and the colour of the window backgrounds. The colours that are
available are the first sixteen colours in the system pallette.

o A bug was fixed; if a large document was being loaded, the size of the
window would not be correct.

o A redraw bug was fixed; the portion of the window that needed to be cleared for a single line movement was being cleared twice (once in white and once in the background colour).

o The "Expand Block" function has been improved. It now shows the name of the file the block was extracted from, and the number of lines in the block. (Previously, it showed the information associated with the parent of the block, and nothing about the block itself.)

o A keyboard bug was fixed; "Window Information" and "Decompression Options" had the same keyboard shortcut!

o MasterBrowse can now be told to write an entire document to disk. As with all of the other output functions, you can decide how (or if) MasterBrowse will format the document.

o "Partial Line Mode" (an option that controls how the block markers are displayed) has been removed. The ammount of time it took to check for the special case was slowing the redraw loop down. In addition, the redraw loop has been optimized for more speed.

o There is now a new block display option. "Bold Text" will cause MasterBrowse to display the block markers as usual (with inverse or hatch) but the text on marked lines will also be drawn in bold.

o A bug was fixed with scrolling to the right. When the keyboard was being used to do the scrolling (as opposed to the mouse) the last column of the text could not be displayed. This has been fixed.

o The alert boxes now have a red icon, instead of a green icon.

o The code that sets the window title bar was cleaned up, which should solve some conflicts (which were apprently random) with other programs.

MasterBrowse 2.8 (August 30, 1993)

o A text formatting problem was fixed; "Print Block", "Clip Block", and "Write Block" all appeared one column to the right of where they should have appeared.

o The "Jump -> Page" feature has been fixed again; it now considers a page to be the number of lines on a printer page (you can set this in the "General Options" dialog box).

o There is a new command line option; "-gemini" prevents Gemini from conflicting with MasterBrowse (system crash). To make the process of adding "-gemini" to the command line transparent to the user, a .MUP script has been placed in this archive. Simply install the .MUP script as an application instead of MBROWSE.PRG (and be sure to edit the filename in the .MUP script so that it knows where to find MBROWSE.PRG). Next, set the following two Gemini application controls; "it is a GEM application" (this will prevent Gemini from playing games with the mouse pointer) and "close all windows on startup" (this will prevent Gemini from opening the Console window to execute the script). When

installed properly, this entire process is transparent to the user.

o There is now a second popup window menu; if you double-click on any line inside a MasterBrowse window, a subset of the "Position" menu will appear on the screen.

o A bug was fixed with right scrolling; with a document that was not as wide as the window, you could scroll to the right anyway.

o A bug was fixed with left and right scrolling with the window arrows; the bell would not sound when the user tried to move beyond the boundaries of the document.

o A bug was fixed in the keyboard routines; pressing ALT-L had no effect, when it should have been calling the "Jump -> Line" function.

o A bug was fixed in the "Find" dialog box; selecting "Cancel" now exits without changing the search strings, or the status of the searching options.

o MasterBrowse is now completely resolution independant; it can redraw the screen using RASTER COPIES (very fast and smooth) in any resolution now.

o MasterBrowse can now use GDOS monospaced fonts in text windows. Changes made to the GDOS settings will not take effect until the next time you enter MasterBrowse, or until all windows have been closed.

o MasterBrowse no longer draws new text windows twice the first time they are displayed.

o The "Set Options" dialog box has been altered (along with the dialog boxes that can be accessed through it). Each of the sub-dialogs now exists as a function that can be selected from the main menu. This makes it easier to change your options.

o A bug was fixed in the line selection mechanism; when the user clicked (or double-clicked) on a line, the highlighting obliterated the text on the line. This only happened if "inverse" was selected as the method for drawing block marks.

o A scrolling bug was fixed; in MasterBrowse 2.6b you could scroll past the end of the file, which would cause a system crash. This is now fixed.

~ ~

Everyone who owns a computer has, at one time or another, needed to view the contents of a text file. The text file viewer supplied with Atari computers will allow you to do this, but it is lacking in many respects.

MasterBrowse is a replacement text file viewer for any Atari computer, in any resolution with a size greater than or equal to 640 X 200. It offers many features that the Atari text file viewer

does not:

* MasterBrowse works with MultiTOS, and should work with other multitasking operating systems for the Atari, such as MultiGEM, Mag!X, and Geneva.

* MasterBrowse has an extremely fast GEM user interface, which makes use of raster copy screen updates, GDOS fonts, pull down menus, progress displays, windows, optional non-modal dialog boxes (and alert boxes), colour, and more. MasterBrowse also provides keyboard equivalents for every single function.

* MasterBrowse allows you to have a virtually unlimited number of documents open at the same time, restricted only by the number of free window handles and the amount of memory available.

* MasterBrowse can use the command line (of course) to open documents (or open a document batch). The ARGV, xArg, and standard command line formats are supported.

* MasterBrowse allows you to use all of your familiar movement keys. You can use the arrow keys, the application keypad, or the space bar and the return key.

* MasterBrowse allows you to move in any direction inside a document, as you would expect. What you might not expect is that you can tell MasterBrowse how far it should move when the movement keys are pressed. How about moving two lines down instead of one? or perhaps three lines suits you better?

Do you still want more? Keep reading.

-You can jump to a specific line, a specific page, the start of a block, the end of a block, or any of ten personal "bookmarks" that MasterBrowse supplies for each window.

* MasterBrowse also offers you the ability to search for up to three strings at the same time inside a document (case sensitive or case insensitive), starting at the top of the document or the current position. If a search is performed starting at the current position within the document, MasterBrowse can be told to search in forward mode or reverse mode. After the string is found, another command may be used to find the next (or previous) occurrence of the string. When strings are found, they are placed in the centre of the screen and highlighted.

* MasterBrowse also has block functions. You can mark a block off, and then save it to disk, print it, or write it to the clipboard. You can decide how the block is marked on the screen. MasterBrowse can also be told to remove the block markers after a block operation is completed. Blocks are marked using the -MOUSE-. More? A block can even be extracted from a larger document and placed inside a MasterBrowse window! You

can even write a block to disk or to the clipboard (with all of the same formatting options available).

* MasterBrowse will also allow you to write an entire document to the disk (with the formatting options available when printing or writing a block).

* MasterBrowse is a master printer. It can print a document (or a block) with page headings, page numbers, line numbers, a description of the file or block, or a combination of the four. It can even print an identification string for those people who share a printer between more than one computer.

* MasterBrowse gives you complete control over your windows. You can cycle through them, change their titles, shrink them, close one, close them all, or get information about them all from the keyboard (or the mouse).

* MasterBrowse saves the positions of the first seven windows, so you have complete control over where your documents appear and how your screen looks.

* MasterBrowse allows you to load and save different configuration files.

* MasterBrowse allows you to load and save bookmark lists.

* MasterBrowse displays (optional) progress maps, just like the GEM Desktop.

* Every window has a set of block markers and a set of ten bookmarks to itself.

* MasterBrowse supports batch files! If you use a certain group of documents often, just load them up and tell MasterBrowse to create a batch file. One double-click on the batch file, and they will all be loaded again.

* MasterBrowse also has support for the clipboard! A block can be written to the clipboard (with or without formatting) or the clipboard can be read into a MasterBrowse window.

* MasterBrowse allows you to interface (transparently) with as many as four external archivers, so that you can save space by storing your files in a compressed format.

* MasterBrowse allows you to move through a document (by lines or pages) using a special Quick Scroll Mode. It uses the shift, control, and alternate keys so that the scrolling speed is not limited by the key repeat speed.

* MasterBrowse allows you to remove the vertical window scroll bar, the horizontal window scroll bar, or both scroll bars. In addition, each MasterBrowse window can have different scroll bar settings.

The features listed above barely scratch the surface of MasterBrowse!

Hello,

There is a new, FIXED, version of ESS UUEncode/UUDecode available. It has been sent to atari.archive.umich.edu and should appear soon as esscod45.zoo in the Newitems directory. It has also been sent to the comp.binaries.atari.st newsgroup. I will try to get it put on some german FTP sites as well.

The new version does not have the message window. I replaced it with non-modal alert boxes, which allow the system to continue multitasking even if an error occurs. The message window only worked on a few systems (and mine was one). Among other things, it could shift all GEM-Text down a line or scramble the order of the resource tree.

I apologize for any inconvenience that the last version may have caused. This version has been tested on a Falcon, a Mega ST2, and a 520STfm (all with different versions of TOS) and shown to work without any of the problems mentioned above. Thanks to those who sent me bug reports (and the person who sent me screenshots). I could not reply to the messages, since the mail was not going out (or the news) for the last few days. I do appreciate all of the messages, though, and I hope that this version is more to everyone's satisfaction.

I recently bought a falcon. But i'm having a little software problem.
There isn't any. I used to have a atari 1040 stfm. But that one isn't
compatible whatsoever.

The only software i have is -the stuff given away with it, when i bought it-
a modplayer (not an editor) and fortune (great program).

My question are: 1. Is there a mod editor available (without me having to ftp
cause i don't have ftp access.)
2. Can you or someone email it to me?
3. Is there a software modem for the falcon.
4. If not, is it possible to make a software modem. I
thought i read it somewhere in a mag.
5. Are there any other pd programs available? Can you
email them to me? (a good jpg viewer perhaps?)

If there isn't any software available, then i'll have to tell all my friends
not to buy a falcon. I don't want to do that. But a computer without software
is not a very good computer. (Don't quote me on that). Don't quote me on that
either.

M.a. Onstwedder,
A Falcon owner.

It's actually a replacement for the AES, not a completely new OS
(which would entail replacing the TOS as well, which it doesn't). Minor
point, but ya know :-)

>It uses less than 200k and does true multi-tasking
>it runs only gem programs tho and is in beta-testing.

I forget if it uses pre-emptive or cooperative multitasking (I hope I
got the two terms right). By itself, it will only multitask GEM
programs. According to what I've read, if you also have MiNT installed
then you can multitask TOS programs as well (through Toswin, I'd
imagine)...

3719. Idea for Atari about Jaguar

Newsgroup: comp.sys.atari.st
Date: 1993-09-08 13:07:24 UTC
From: winters@access.digex.net
Message-ID: <26klec$j7b@access.digex.net>
Source record: 201521

I have an idea and it seems so obvious, I can't figure out why Atari
isn't doing this. Maybe someone knows some E-mail addresses of
Atari employees/marketing-types etc... that they could post?
The idea is for Atari to offer a version of the Jaguar that has a
keyboard attachment and an interface circuit, so home computer
hackers can program the thing, just like the old Atari 800 or ST....
It appears that Nintendo and other game system manufacturers have
"closed", non-programmable systems, since they only want developers
who have expensive equipment and that will provide them with the
opportunity to sell $60 + game cartridges to consumers willing to
pay that much money for one single game. Even today, you can go
to Toad Computers and buy the latest games (flight simulators, just
programmed in Europe, say, the last few years) for $30 to $45. That even
is cheaper than most game cartidges of decent games. I'm sure most of
you would love to be able to mess around with the Jaguar. Has anyone
heard any plans to open it up to the general public, similar to the
old Atari 800?

>the numbers.
>
I ordered the second retail Falcon at my local dealer. Because of the problems with memory boards, it was either the seventh or eighth he delivered. I know of 2 more orders he got after that, and I sincerely hope there are some I don't know about (I only knew one person who got a Falcon here by the time I got one)

Pretty poor, but by Atari standards, a hit.

Steve

Well, there are reasons for this closed systems: As far as I can tell, the Jaguar is to be sold below its value, and Atari thinks to get the money back through cartridge sales. But if there is a wide market of cheap disk-based games by other distributors, they won't get a nickel out of it.

Though, I myself would love to see a keyboard and floppy/hard drive attached to it. My ST's getting a little small and slow, and I'd love to have a game console for fun, that is at the same time a reasonable computer for word processing etc. (My, with that graphics it'd make an excellent DTP machine, wouldn't it?)
Probably the architecture would have to be re-designed. It's not so easy to hook a keyboard to such a device... but a nice idea, anyways.

My hard disk is packed full of programs that run on my Falcon. There's lots
of PD and Shareware as well as commercial applications. Most are not Falcon
specific but run happily on it, about 3 times faster in fact. For a JPEG
viewer tri GEMView, a very nice program. Just look around the boards,
there's loads of stuff.

Uh-uh. Definitely an opinion in the sound field... Personally, I think it's
shitty for sound. Hmm, then again, that's what you get when living with an
audiophile....

>The idea is for Atari to offer a version of the Jaguar that has a
>keyboard attachment and an interface circuit, so home computer
>hackers can program the thing, just like the old Atari 800 or ST....

From a technical point of view, it seems to me that an OS for a
full-blown computer (with keyboard and user programmability) is
much more complex than one for a game console that has to deal
with a ROM port type thing and possibly a few other ports only.
Therefore, I don't think it would be that easy to re-design the
Jaguar to be user-programmable.
Anyway, I guess the main reason for Atari to make the Jaguar a
closed, game console system is that they figure they can make
much more money that way. It's sick but true -- Atari is in the
business to make money, not to bring us good computers. In the
whole economy, it happens only very rarely that corporations make
money by bringing consumers something really useful and valuable.
We Atari folks have gotten kinda lucky in this respect since the
middle of the eighties a few times, but it looks like this period
is drawing to an end.

Hi,

developpment of really good and professionell game software is neither easy nor cheap. Hardware-Companies like Nintendo or Atari are not interested in semi-professional software products because bad software dammages the image of a system. Therefore Atari selects Jaguar developpers per hand (that's what a Atari official told me). It's better for them to have 20 really fascinating games than 200 bad ones.

Well you can try GER2EN30.LZH. Its available on atari.archive.umich.edu
on applications/other or something like that.
GER2EN30 is free. You can use it as much as you want. If you want
CV-Translator v1.0 (German, Dutch, Spanish, French, Italian, Portuguese
--> English) you've to send $US20. The address is in the program.
You can also reach the author on carlos_varela@pleiades.org or .com .

Good Luck.

Message-ID: <1993Sep08.185922.5065@rat.csc.calpoly.edu>
Source record: 201547

I have two different copies of ZOO.TTP (THE 37K version, and the 80K version.) I have NEVER been able to unpack ANY FILE with .ZOO ext., with these programs. Why? Usually, it gives a bad CRC value or something like that.

Can someone reccommend a ZOO.TTP that works?

Thanks.

Chris.

3739. HELP WITH ZOO.TTP

I use the version compiled for MiNT, Mint/Utilities/bmintzoo.tos at a.a,
and had not problems at all. I've also used bammi's port,
Archivers/++jrbzoo21.zoo, with similarly stellar success. Then again,
I've used every version of Zoo since 1.4 and never had problems.

I am reentering the second Quartically converging program below by hand - see if it agrees with what I have been distributing. If I have distributed the wrong algorithm, then I need to correct it tout suite!:

Let a(0) = 6 - (4 * (2^(1/2)))
Let y(o) = (2^(1/2)) - 1

$$y(n+1) = \frac{1 - (1 - y^4)^{1/4}}{1 + (1 - y^4)^{1/4}}$$

$$a(n+1) = a(n)*(1 + y(n+1))^4 - 2^{(2n+3)} * y(n+1) * (1 + y(n+1) + y(n+1)^2)$$

Yes, your p(500) is correct, according to my copy of Shanks & Wrench 1961 run to over 100,000 places.

BTW - I have the 'P' term of the first equation as:

$$p(n+1) = \frac{p(n)*b(n) * (1 + a(n+1))}{1 + b(n+1)}$$

If the b(n) on the top of the division should be b(n+1) instead, then the printing of Bailey's 1986 study in Mathematics of Computation is wrong.

Other reminders....

1) I have yet to decide whether or not to release the 'time trials' as they come in. It might bias others...

2) the 'time trials' will be conducted on my 520ST with 1 Meg and TOS 1.4. Times will vary according to machine, is my assumption.

What is your opinion: do you want your time trial results to be released before the end of the contest ?

I used ghostscript for the ST a few times, with mostly favorable results.
However, I could only get the Epson print driver to work, which is a shame
since I was printing on an HP DeskJet. The Epson emulation cartridge could
handle it, but with lots of (IMHO) extraneous "print head" movement. Has
anyone gotten any of the HP drivers to work?

[>
[> What is your favorite terminal software for the ST and why? I have
[> searched the FAQ for this information, and I don't believe it's there. I
[> only know two programs, Interlink from Intersect and Stalker. I have
[> serious problems with each of them, but I prefer Interlink.

Without a doubt, CoNnect is the best you can get. I'll tell you why
below:

[> Interlink doesn't include zmodem as an integrated function but must call a
[> third party shareware program that I downloaded from the Intersect BBS.

CoNnect _does_ include Zmodem, as well as Ymodem, Xmodem 1K, Xmodem, and
Compuserve B/B+ (as well as an excellent ASCII uploading facility).

[> This zmodem program does not provide for choosing between binary and ascii
[> transfers. Everything is binary. Therefore, I have to boot my STalker
[> every time I want to download ascii files from the VAX that gives me my
[> Internet access.

The CoNnect implementation of Zmodem does allow you to choose between
ASCII and BINARY. It can also allow you to choose your error correction,
and set a few other key options.

[> For everything but zmodem ascii downloads I prefer
[> Interlink because it is faster, less buggy and does a better vt100 terminal
[> emulation. Also, I love the ease with which I can make ascii files on
[> floppy by saving the capture buffer. I have never learned how to do this
[> with STalker.

CoNnect is _very_ fast. It is always faster than STalker, and you can
make it even faster by setting a few options. It has no trouble
keeping up with my 14.4K modem (though the display is a little jerky,
which could be due to the modem).

[> STalker has a much nicer dialer than Interlink and setup is much easier.
[> But my copy lets me down from time to time; and when I'm logged onto the
[> VAX, I often have to use <shift><clear home> to see my $ prompt. It is a
[> terrible annoyance. The zmodem works great though, and I would be lost
[> without it.

CoNnect has an incredible dialer. It has to be seen to be believed!
It works a lot like the desktop, in the sense that you can delete
numbers by dragging them to the trash can, or dial them by dragging
them to the telephone. You can sort entries just by dragging them
to the place you want them to be (or let CoNnect do it for you). You

can operate the entire dialer with the keyboard, if you want. As I
say, it has to be seen to be believed.

[> Surely there are better term programs than either of these for the ST?
[> What is your favorite? Why do you like it? What do you dislike about it?
[> If you send me email, I'll post a summary.

You also mentioned (somewhere above) that you need VT-100 emulation. The
emulation of CoNnect is flawless. You can even set it up so that it
is compatible with VT-100 implementations that are flawed.

There is only one complaint that I have seen about CoNnect. Some people
do not like the font in medium resolution.

Also, it uses quite a bit of memory. I am not sure if you can run it
on a 512K machine.

[> --
[> --------------- John W. Redelfs, tsjwr@acad1.alaska.edu ---------------
[> --------- All my opinions are tentative pending further data. ---------

I hope this helps you out. CoNnect also has hypertext style online
help, a facility to calculate telephone charges (which can create
little bar graphs showing how long you were connected to each system,
or how many times you called, or how many times you called between
one date and another). It has non-modal dialog boxes (inside windows)
so that you can access your accessories even while inside a dialog
box. There is simply too much to mention. You can get it in the
Telecomm (or is that just one m in Telecomm?) directory at
atari.archive.umich.edu. The file should be called something like
conn2* (grab the one with the highest number).

Tacking a 16Mhz CPU onto an 8Mhz system only gives modest improvements,
even with a sizable onboard RAM cache... 50% in an average environment
seems to be about the max, unless you happen to have code that executes
in very tight loops.

This is exactly the same trick Intel plays with its "DX2 speed doublers".

Fast if it doesn't have to go outside the cache, not much faster if it does.

There _is_ a monochrome MOD player called PTPLAY. It is a modificated version of
PTREPLAY by Martin Griffith. Works on normal ST and the replay frequency is 17KHz!
Also, it handles all ProTracker commands. There are no equalizer bars or other
graphic stuff but the replay quality on YM-2149 is amazing!
You can find the file PTPLAY12.LZH at ftp.tu-clausthal.de in /pub/atari/sound
but I guess it's also in atari.archive.umich.edu

Hope this helps
Chris

...and it doesn't make that much difference when someone is
moving up from a 6502, either. Both emulations would be an improvement, so
why is this debate important to a 6502 owner? I own neither an ST, nor a
TT, nor a Falcon. None of these machines are discussed in
COMP.SYS.ATARI.8BIT.

DM> You're confusing the issue of speed with the issue of processor.

...Uh, yes! I guess I am as well. I don't understand the
relevance that this discussion has with my processor, namely the 6502 ?

???
(If this discussion has anything to do with the 6502 8-bit ATARI
computer, then I apologize in advance.)

Message-ID: <1993Sep9.112702.20597@ohm.york.ac.uk>
Source record: 201435

There's been a lot of Falcon bashing in this news group recently, the mood seems to have changed a great deal from a few months ago. I too, am concerned with Atari's commitment to the Falcon, having invested over a quarter of my (allbeit small) income on my Falcon, HD, monitor and software this year. I'd dearly like to see the price drop by (here in th UK) 150 pounds. The addition of a 20M HD and another 1meg of ram on the base model would make the 600 pound price of the base model a bit more realistic.

However, maybe Atari are showing some commitment. The most recent Atari ST User magazine reported about the near completion of TOS 5, with parts of MultiTOS on ROM. Atari seem to release new versions of their operating systems with a new machine, so does this mean that a faster (cheaper) falcon, maybe even an 040, is just around the corner?

I really hope so, because I get the feeling that in a years time Atari are just going to turn around and say that they're dropping the Falcon after poor sales and concentrating on the Jaguar... With two new falcons, surely even Atari wouldn't just abandon their investment having developed some great hardware but neglecting to sell it?

Hi there!

I'm looking for the last version of elvis (vi-clone) for
atari. The last version i have seen is elvis16 beta dated
16. Nov 1992.
Since there is a version 17 available (on PC) i'm wondering if
someone has ported this to the st?

Where do you live? There's nothing interesting close to me... ;-) How
about "I'll buy you the game of your choice for your new Falcon040 (or
whatever)." and you can buy me a Jaguar game.

A Falcon030 in a new case doesn't count unless they change something
else; say better graphics and SIMM sockets, for example (just putting in
one of those shouldn't count, since _other_people_ have already done the
work for them), or a faster system.

Source record: 201397

Hi!

I seem to be having this problem with running MiNT 1.09 and eXtended FileSystems, (running under MultiTOS) namely that they simply don't. The XFS files I have (ramfs.xfs v. 1.4 and minix.xfs v. 0.60) are not loaded by MiNT at bootup. Now, if I use MiNT 1.05, they are loaded (and work properly), but with MiNT 1.08 and 1.09 they aren't loaded.

I have a TT030 4mb/4mb and am running the release version of MultiTos.

What could be wrong?

I have to say that I detest this idea of selecting "the best", and from my personal experience and observation I doubt such a strategy can be a success in the long run. People who are really good don't like to be selected that way. People who want public attention like it a lot. Chasing for public attention is quite incompatible with becoming really knowledgeable -- abilities acquired out of genuine interest will always outperform abilities acquired merely for the sake of attention that can be gotten with them...

Heck if I know, but I do have a file called "raiden.jpg", which has some
screen shots of the Jaguar game Raiden. If anyone is interested, you can
ftp it from ftp.math.fsu.edu (192.12.122.28) in the /pub/atari.

The latest greatest version of Uniterm is 2.0e015, available from
chsun.chuug.ch in the /software/atari/UniTerm directory.

I've had it! I've finally got to voice my opinion on CD-ROMs as they
apply to video games. Certain types of games need hudge amounts of data
IMMEDIATLY available to them (I hope you will agree with me that CD-ROM
access is not immediate). For my example I will use a Mortal Kombat type of
game (2 player simultaneous fighting). The game systems (3D0 included) do
not IMHO have enough RAM to store 2 COMPLETE fighters at once (plus code and
background scenery which also need to be in RAM). All possible moves of both
fighters currently engaged + background scenery + program code must be in
RAM during that particular fight (unless you don't really care about
playability, THE most important characteristic of modern fighting games).
3D0 has 2 Meg (maybe 3) of RAM, SEGA-CD has I think 768 K.

In general I think CD-ROM is way overrated for video games. They could be
useful for RPGs with very large worlds or also for games with FMV (but who
wants to play FMV crap? not me ...). If a CD-ROM game system came with a
butt-load of RAM this problem would be solved.

I'm willing to bet that Mortal Kombat as a Sega Genisis cartridge PLAYS
better than Mortal Kombat on Sega-CD (this release could be the first
real test on my theory I described above).

um.... Mebbe I'm missing something obvious here, but why didn't you just
use
PI = 4 * arctan(1)

? Then your arctan formula is trivial to evaluate, all the exponentiated
numerators are equal to 1.

3786. Falcon Video Connector Help & Some Tips

Newsgroup: comp.sys.atari.st
Date: 1993-09-10 00:37:03 UTC
From: scotty@verdix.com
Message-ID: <1993Sep10.003703.29553@verdix.com>
Source record: 201448
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello fellow netters...

Please help me with the following request if you get a chance. Afterwards I will share some possibly useful information regarding getting the Falcon squared away.

I'd like to adapt my Falcon's VGA video connector plug so that it will allow my multisync monitor to display true color mode. Unfortunately it programs the Falcon to think that I have a VGA monitor, which disables the true color mode in the "set video" dialog.

I believe this is done using the pins M0 and M1 on the video connector. Can someone please tell me how these pins are connected for VGA and for an Atari Monitor adapter?

Toad Computers is planning on selling a switchable adapter, but they have no idea when it will be available just now...

Here are some possibly useful tips I have extracted on setting up the Falcon030:

1. My Falcon's internal IDE drive had the dreaded spin-up, spin-down problem when I first took it home. It was obvious from the sound it makes when the room is relatively quiet; the drive also seems to take forever booting up and loading certain programs (alas, Nethack was a good test).

My dealer had no information on how to fix the problem; they said that some of the 65 Meg drives on earlier units had been replaced, but none of the machines with Conner 84 Meg drives had the problem. They recommended that I call Atari, which I did.

The Atari Rep I spoke to was unusually helpful. He said that a metal shield had been installed incorrectly on the left side of the IDE drive, and that it needed to be moved to the right side of the drive in order to make proper contact with the top shield.

This shield is a bent piece of metal (ie. spring) which compresses when the top shield is put in place. The orientation of the bend (to the left) must remain the same when the shield is moved to the right side of the drive. This is important, because otherwise the speaker won't fit anymore.

I had this fix done, and the problem is all gone! Booting takes 10 seconds or so now, where it used to take a few minutes sometimes.

2. Having trouble setting up GCC on your Falcon? I sure did! Some of the programs I was trying to use just wouldn't work. If you're going to use the TOS filesystem, here's a combination I found useable:

BASH 1.10, GNU Executables ver. 2.4.1, Gnu Libs & Includes ver "93", G++ Libs and includes ver. 20. Compiler.h has the number of streams specified, but this is determined in stdio.h; comment out the #define in compiler.h and you're in business. You don't have to guess: GCC-CC1P(LUS) will point out

history saves. Since the TOS filesystem shortens both of these to .BAS, I made my ~/.bashrc (.BAS) read-only. This sacrifices .bash-history; there's probably a better way to do this on a TOS filesystem, but it works.

Lastly, all of the command files in /BIN need to have their .TTP or .TOS extensions removed for BASH. Without this renaming, you'll either have to type ls.ttp to get your directory, or alias all of the names with extensions to those without (yech)!

3. This one is of interest to those who have LQ800 compatible graphics printers. My 24 pin Epson ActionPrinter L-1000 is one. Try the following Speedo GDOS printer drivers, in this order: LQ570, NEC P-Series, and the Star NB-24 driver. My printer requires the NB-24 driver because it can only handle 180x180 graphics mode. The first two drivers use 360x360 DPI. I got this from the Atari Rep as well. Thanks!

Well, hope these hints help some of those who bother to read this far. And thanks again to anyone who can help me with that video connector!

3792. Modem/Terminal programs... favourites?

Newsgroup: comp.sys.atari.st
Date: 1993-09-10 02:41:45 UTC
From: uberig@gfx.engga.uwo.ca
Message-ID: <1993Sep10.024145.12932@julian.uwo.ca>
Source record: 201352

Hi all,

I've been looking for a nice, fast, full-featured, and flexible modem &/or terminal program for awhile now. I can't seem to find one that has all the features I'd like and retains the speed I like. The best package I've run across so far is Uniterm v2.0e015, but it has two drawbacks on my shopping list: 1) No Z-modem builtin (a convenience that I don't want to live withou); and 2) The macro capabilities (at first glance) seem to leave a little to be desired compared to some other packages like Stalker 3.0 or Flash 2.0 (although, I guess that's one thing you get when you _pay_ for a package :).

Anyway, as much as I do LOVE UniTerm, I can't bring myself to live without Zmodem and a nicer script/macro interface. So, on to my REAL question:

"What's _your_ favourite, PD/Shareware/Other, and why?"

PS- Please respond via E-mail if possible and I'll post a summary of opinions after a few days or so.

Please send to: uberig@gfx.engga.uwo.ca

Thanks!
Jason.

Atari bashing I can understand, but the Falcon seems like a pretty nice little machine. I recently got a look at a freind of mine's, and I found it to be much better than a lot of people on this network make it out to be (and I'm comparing it with my TT). I was quite impressed with the sound and graphics. He's got the whatever-it's-called program that lets him display 1280x960x16 with a little flicker, and about 3/4 that real clear, and on a cheap VGA. I found the windows, scrolling, etc., to be quite acceptable (without an accelerator). And I thought Multi-TOS did a pretty good job, not as good with keyboard/mouse inputs as X-windows (X11R5) but better than Sun's Openwindows. (No multitasking is perfect--I work on Sun Sparcs and Convex supercomputers, and they get bogged down when busy. And need I mention VAX computers--when they're busy you can just forget it.) Also, Atari Works seemed quite usable--not as fancy as the Mac/Windows stuff, but 95% of the time you don't need all the fancy stuff that you fork out the big money for.

So why don't I buy a Falcon? Because it's slower than my TT. But if they came out with an 040 design with a TT type case, etc., I would seriously consider getting one. And hopefully Atari realizes that there are people who are looking for something with competitive speed.

yes i know, i got this message allready in an other context, but this time i got nothing.
so i didn't found the solution immediatly.

> >by the way, has someone an aes
> This would be of course a violation of Atari's copyrights.

of course, but if atari doesn't update the owners regularly (i still haven't got
mint and speedo. they promised to send it to everyone how has bought their falcon before
they began this) you must try this way.
and i think the aes could realy be updated (i still waiting for a version with flying-
dials and not only the alertboxes and some other changes)

Try 'PI = 4 * arctan(1)' and see how it converges. Then you'll know why
not to use this formula.

1^n doesn't get very small for n = 1,3,5,7,... :-) but (1/8)^n, (1/57)^n,
and (1/239)^n do.

3803. C compilers -- a couple of questions

Newsgroup: comp.sys.atari.st
Date: 1993-09-10 12:25:02 UTC
From: PETERC@v2.ph.man.ac.uk
Message-ID: <1993Sep10.122502.14242@nessie.mcc.ac.uk>
Source record: 201368

Hello all,

Sorry to bother you again but I have a couple of questions
about C compilers on the ST.

1) Where are the include files for Sozobon 2.0 or are they not necessary?
I downloaded all the files in
/computing/systems/atari/umich/Languages/Sozo2
on the Umich mirror at src.doc.ic.ac.uk

2) I have also got the Heat n Serve C compiler version 1.40 but
I can't install it.

Carrying the instructions given in the document "install.doc":
I get as far as running the program from Desktop and working through
the menus only to come unstuck after the install program loads
in the binary PDF.

It creates the directories on the target disk and sets about
unpacking the executables. After doing "ar.tt", it gives two
bombs and the message
"missing required file
a:\sozobon\bin\cc.ttp
please ensure output disk has
enough space before retrying"
then returns to Desktop.

On examination of the target disk, the sozobon directories
were created and in the bin subdir there was a zero-length
executable "ar.ttp".

FYI, I have a 520STFM with internal 720K floppy drive.
The target disks were formatted just prior to the attempted
installation.

I will be most grateful if someone can help.

Thanks in advance,

Peter - peterc@v2.ph.man.ac.uk

Well, that depends on what you want to do.

You can draw nearly anything as a monochrome bitmap and then use vrt_cpyfm()
to transform it into a multiplane raster, give it the colour you want and
copy it into a multiplane raster.

I'm using this method in Overlay, and we haven't had any problems with it.

But how does one use memory.sys in the first place????? I've seen no documentation on this.

You're on. And we have all these witnesses. I'm a little less confident
of a bigger improvement than the case, but for small stakes, what the hey.

So: one game changes hands depending on whether Atari releases a new computer
noticeably different from the present Falcon by Jan 1, 1995. I hope you'll
agree that it's released if Atari says it's been released. Maybe if
there's any doubt we can say that if they say it's been released that sets
the date, but we'll wait to settle until someone buys one retail.

The only problem I can think of right now is that you have too little
memory available to unpack these (zip) files.
Try loading a clean system without any accesoires and autofolder things
or ram-disks.
If that does not help enough, try running St-zip or even stzipjr
(stzipjunior) and extract these .pdf files by hand.
Or try installing some more memory ;-)

Erlend.

I have had two bad experiences with St magazines this week. I hope you can help me with the second one.
First I bought ST Magazine/TOS/ST Computer, the three magazines that are now one. Well they had some blank pages. Luckily nothing really serious, just some column and some adverts and some pd info.
Second I bought Atari ST User which features both Word Writer and a Cyberdrome demo this month...
Well there is this strange thing with the coverdisk. The bootsector says it is a 81 sector 10 sectors per track disk. But, I get lots and lots of read errors. On every track, not just some. If I check the disk with some programs, it turns out that there are no errors if I read using 80 tracks and 9 sectors per track. When I check the used diskspace (total of all files) it totals 715000 bytes or something close to that. So it would fit on a normally formatted disk. A copy with 9 sectors per track will not work. I am pretty pissed because if I send the disk back for a replacement, 1) it will cost me extra money 2) I will have to wait a whole month 3) I will probably not get a disk with a nice label like the one on the magazine.
So do others have the same problem? It appears to be something that went wrong while packaging, not an ordinary faulty disk.
Could someone send me (zipped and crypted of course) in e-mail the files on the disk? The crypt can be any word from the magazine (since I have the magazine)
I would be very grateful.
Thanks in advance, Erlend.

3813. Zmodem which keeps the minix/unix fileformat

Newsgroup: comp.sys.atari.st
Date: 1993-09-10 15:59:54 UTC
From: Jan_Willekens@p12.f202.n281.z2.fidonet
Message-ID: <2c90a5ee@p12.f202.n281.z2.fidonet>
Source record: 201398

Hi!

Is there any zmodem program for the ST which keeps the minix/unix
fileformat when zmodeming from a unix to a TOS system without tranforming
the filename to the 8+3 format?

The problem I have is that when I log into the university from home, FTP
some files and then zmodem them to me, the zmodem program on the ST (eg.
the zmodem 'program' in CoNnect 2.20) converts the filenames to the TOS 8+3
fileformat. I don't want this to happen, since I let the zmodem program put
the files onto my minix partition. Now it put these files in 8+3 format on
the partition, but should leave the long unix filename intact.

Thanks!

Greetings... - Jan -

IMO it's stupid and unnecessary to demand builtin zmodem when you can call up an excellent external zmodem program from any decent comm program by pressing one key. Try XYZ 2.xx by Alan Hamilton(?). External protocols are great because you can upgrade the file transfer software without changing the whole term program!! Especially when most of the best ST term programs are not supported at all anymore.

3815. CS-TeX without the GemShell. How?

Newsgroup: comp.sys.atari.st
Date: 1993-09-10 16:22:02 UTC
From: hstaalm@cs.vu.nl
Message-ID: <CD5C4r.53D@cs.vu.nl>
Source record: 201378

Can anybody tell me how to configure a command line shell, thus without the
`standard' GemShell? For example with the GPshell(No PD) or under Mint with the
TC-shell (this shell is absolutely MY best). I do set the environment
variables right (at least, I suppose I do so) like the path, etc. I don`t know
wether it is possible to set the TEXDIR, TEXFONTS, TEXINPUTS and MFINPUTS
variables such that they are realy used.
When I try to compile a TeX file, he's complaining about the fact that I must
first generate a plain format (which is already done, and accessible via the
path variable).
Any idea is welcome.

Please reply (also?) via email.

Thanx

Probably true -- Atari is still rebuilding their dealer network.

>That zippy Mandlebrot demo sure helps me do my work faster (ray tracing,
>compiling, DTP, etc)... And it's one of TWO pieces of DSP software that
>I've heard of since the Falcon's 'release'... The other is the DSP JPEG
>software that people are licensing from BrainStorm.

The Mandelbrot demo is considered to be the best indicator of overall
system performance. Nobody would pretend it's a "real world" application.

>Who uses DOS?

Floppies and Hard Drives are "extras" on MS-DOS systems. The basic
input/output system (BIOS) in the ROM doesn't deal with them in
sufficient detail to make the operation easy or straightforward. That's
why you need a Disc Operating System (DOS). If you're using a disc,
you're using DOS.

>Good luck doing a ray-trace on a Falcon is < 1 minute for 320x200x24-bit
>colour. And don't try saying, "Yah, but re-write it to use the DSP and
>it'll rip!" Sure it would, but I'm not going to re-work several
>thousand lines of someone elses code just to get more performance; it's
>easier to just spend the same amount on money on a faster CPU (not that
>I would; I'd rather have 12M of RAM and a decent display, like
>800x600x16-bit).

It always takes some time for the software to catch up with new
hardware. When the original IBM-PC was introduced, there was a
very small list of applications that would run on it because it
wasn't an Industry Standard CP/M computer. A quick, quiet death
was predicted for the Non-Standard Hardware and Software.

Here we are years later, and most people don't even know what CP/M
stands for. And we're going through the same development cycle
again.

>Software will never be available for the Falcon. It's been out for
>what, a _year_?

The Winter 1992 issue of the International TOS Software Catalog ($12.00 from your local Atari dealer, or direct from Atari) is an inch-thick compendium of ST/Falcon software. Outside of the USA, it's about 2.5 cm thick. :-)

> There are very few applications that use the DSP, and
>there have been no more Falcon machines announced.

Good software takes time. And Atari, having been stung by "Vapor" announcements in the past, doesn't announce things until they're done. We could speculate on '040s or '602s, but it would only be speculation.

> I really don't care
>if Atari is concentrating on the Jaguar (hey, haven't they heard of
>multitasking?!?), but I don't want a console,

(This is an attempt to confuse me, right? :-) When did Jaguar enter this discussion? Well, I'll go ahead and answer anyway from a Falcon standpoint.)

Lessee ... the '486 @ 66 Mhz system ran the benchmark in 6 seconds, the Falcon ran it in 4 seconds. Do you really consider these systems to be consoles? If you do, you must desire something so advanced that it's not available on the consumer market, not just a mere....

>'040-based computer (with a decent case and a good keyboard; don't
>underestimate ergonomics!).

Amen on that good keyboard! If I could get a computer keyboard that felt and acted like an IBM Selectric I could *really* churn on my reports!

>> Because Atari programs are more compact then their MS-DOS equivalent,
>> an 80 Megabyte hard drive gives space equivalent to 240 Megabytes on
>> a clone. GEM doesn't require 4 Megabytes of RAM and 20 to 30 Megabytes
>> of disc space to operate. Microsoft Windows does require all of this.
>
>You really are dreaming. A good word processor, with lots of functions,
>takes up lots of space on any platform. Granted, nothing takes up as
>much space as Micro$oft apps...

I had 10K of "C" source code that compiled to about 5K on the Atari ST, but ballooned up to 19K on an MS-DOS machine. Sure, features add space, but the inefficiency of the clones adds unnecessary space.

>Don't you think your computer uses would benefit GREATLY from a
>multitasking OS? Not Windoze, something that really multitasks, like
>OS/2?

As an evolutionary development, yeah. And when I get my Falcon, I'll be running Multitos.

>Obviously, you can say, "My computer does all I want it to!" and I'll
>say, "Yah, eventually." I guess you don't care that Calamus isn't

>running terribly fast, or that your spreadsheets take a long time to
>calculate. Me, I don't like to wait for my computer.

When I see speed decreases, it's usually when comparing my machine
at home with my machine at work. It's pretty much a standing joke
around here that I can be seen tapping my MS-DOS box on the side,
saying "C'mon, c'mon, I've got an Atari at home faster than you are."

>pity Atari's never going to release another computer (after all,
>they're concentrating on the Jaguar now).

According to the Atari Annual Report, Atari considers itself to be in
both the video game and computer markets. They put a lot of work into
the Falcon, now they're putting a lot of work into the Jaguar (and
using it with the Lynx, as well!).

CH>without the ACC loaded), since it's so cool...

It can't - Before Dawn uses GEM, and the main part is in the ACC. The
resident part is necessary only because ACCs are not allowed to steal
system vectors (which is necessary to detect keyboard (, midi, ...) input.

I have the following hard drives for sale:

20Meg MFM Seagate ST-225

Condition: It's a bare drive that has never been used.

80Meg SCSI Seagate ST-296N
w/ICD Host Adapter and FA-ST case (room for 2 drives).

Condition: a few bad sectors and I have gotten an occasional
Sense $04 (Drive not ready) during boot ups.

All drives sold as is.

I'm looking for offers on the drives. Local or nearby offers have
preference, but will consider all offers.

For Atari users, the FA-ST case and host adapter still can be used,
and if needed, I can leave all the PD software that is installed on
the SCSI (or I can reformat it).

If it is a serial mouse (very likely), you cannot do it. If it is a bus
mouse, you can make a special adaptor to do it. I am almost positive that
that all PS/2 mice are serial, but you may wish to check this out.

The document describing how to hook a Microsoft bus mouse to an ST should
be available from atari.archive.umich.edu. If not, email me and I can put
it there.

A couple of stupid things.

1) I have thegame WIZBALL. I like it but am very frustrated by it. Is the ending worth the trouble of getting the colors in the right combo? What are those darn question marks on level (5 or 6) in the stalgmites?

2) I need a really cheap, small hard drive. I am thinking 10-20 megs. I just want to use it for sequencing and am on quite a budget.

Thanks

True about the space requirements ... I saw the WindowsNT distribution
package at CompUSA the other day (I was buying generic diskettes),
and the minimum requirements were 70 Megabytes of disc space and
12 Megabytes of RAM. That's just to get started.

OS/2 isn't quite so bad: (just guessing, here) it requires 40 Megabytes
of disc and 8 Megabytes of RAM. Just to get started.

MultiTOS requires *lots* less: 10 Megabytes of disc and 4 Megabytes
of RAM (according to my local Atari dealer), and that's allowing for
a "lot" of RAM to run a "lot" of applications. BTW -- the dealer points
out that MultiTOS does true multitasking, in that all applications get
a share of processor time. Apparently, Microsoft Windows doesn't have
this feature.

Actually, OS/2 requires ~35 megs of drive space, and will run in 4 megs of RAM (But 8 works a whole lot better). However, the 35 megs includes the full installation - it includes the OS/2 operating system, a full implementation of DOS 5.0, the full version of MS Windows 3.1 (Win OS/2), and several nifty little applets. OS/2 by itself takes ~17 megs of drive space if you can live without DOS and Windows.

MultiTOS sounds nice, my only complaint is that I can't find software locally for the Atari anymore. It seems somewhat pointless to have a multitasking envirionment with virtually no software to multitask :)

^^^^^^^^^^^^^^^^^^^^
Wonder where he got this number from? In my MultiTOS folder
there are 11 items, at under 405k. Say an even 500k for whats in
the AUTO?
Now, this is straight out of the box from Atari. There is just
one distribution disk for MTOS...
On my 84mb (standard) drive, I have 66mb free - thats after
installing all the distribution disks: the language disk, extra
programs, MTOS, Works, SpeedoGDOS, a non-Atari looking disk labled
'Falcon software' (including AFM, D2D, etc).
Also installed is the ScreenBlaster software, plus a few
other choice programs.
All this, and its taking up less than 20mb.

>of RAM (according to my local Atari dealer), and that's allowing for

>this feature.

RAM is a problem on MTOS, as any multitasking system. 4mb
is just NOT enough... After booting MTOS, I have about 500k left
of usable RAM!
I am waiting for the fake RAM price hike to fall off before
I start looking for a 14mb board...

And on the topic of multitasking systems, and word on
Linux-68k for the Falcon? (and puhleeeze dont give me any
stuff about 'the falcon aint powerful enough')

I surely hope that Atari WON'T release ANY Falcon model with less than 4 Meg
RAM that is not specifically made for 3:rd party upgrading ...

All programmers will use 4 Meg, since that's what all Falcons so far has had.
If they released 2 Meg machines nothing (except OS programs ofcoz) would work.

Well, select 40 columns and then select True Colour.

Everyone can run True Colour on a VGA-moitor, that has nothing to do with it.

Well, if ram is so inexpensive in small quantities, why do both the
jaguar and the 3DO come with only about 2MB each?

I think that even in quantity, that per/MB cost of ram has to be at
least $40 for these systems (which will need fairly fast memory to
handle all of the data being thrown around). I personally think that
adding $80 for 2MB more of RAM might make the Jaguar much less
saleable (brakes the magic price barrier), and perhaps throw the 3DO
out for a lot of others.

While it is true that you can store a lot of stuff on there, it is
very expensive (timewise) to get anything off unless it is very large
and sequential. While it's great for movies, and perhaps for
background music (as long as you use the CD for nothing else while the
music is on), animated parts of the game and short sounds used during
the game will have to be loaded into memory if there is even a chance
of thier use in the portion of the game you are playing.

>> I would like to connect a PS/2 mouse to my STe.

>If it is a serial mouse (very likely), you cannot do it.

It's possible. You plug the Mouse in a serial port and put something in
your AUTO-Folder, like Wrapmouse or mouse22 (on 131.234.2.32 - paderborn).

This works fine , but you loose a serial port, so it's good to own a Mega STE
or a TT...

So long T34

3840. Re: Atari vs the EXPENSIVE world of DOS

Newsgroup: comp.sys.atari.st
Date: 1993-09-11 04:10:51 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <90237@cup.portal.com>
Source record: 201251

A minimum installation of OS/2 requires 20 Megabytes of disk storage.

MultiTOS takes a LOT less space because MultiTOS *does* a LOT less.

Windows does true pre-emptive multitasking... that dealer should read
a few magazine articles.

ALL computers require a disk operating system. TOS includes it in ROM,
the PC loads it from disk. If you're using a disk, you're using a disk
operating system, true, but on a PC it's not necessarially MS-DOS. (You
have a choice).

Atari has been "rebuilding" its dealer network for the past seven years.
It's worse today than it's ever been.

The Jaguar was brought up because Atari has virtually abandoned the Falcon
already, putting (according to Bob Brodie, just to satisfy Warwick's
curiosity) all its resources ($35 million, down from the $50 million
they said they had to launch the Falcon) toward launching the Jaguar.

3841. GFA Manuals?

Newsgroup: comp.sys.atari.st
Date: 1993-09-11 04:37:25 UTC
From: ah977@Freenet.carleton.ca
Message-ID: <CD6A6D.42s@freenet.carleton.ca>
Source record: 201400

Can anyone recommend a good manual for GFA Basic? I have Version 3.5
(The version which came with ST Format last year; once I become comfortable
with GFA, I'll probably buy the compiler.)

The disk had a reference file, but I was looking for something
which can start with the basics. (I've never done any serious programming
for the Atari, but now I've got some free time on my hands, I thought
I'd try my hand at writing stuff for the public domain, returning the favour
for all the support I've gotten.)

My current favorite is Freeze Dried Term. It has Zmodem via XYZ.TTP, and
it allows you to add other transfer protocols as they come (assuming that
they are a TOS Takes Parameters type protocol). It has nice ANSI emulation,
much better than most. It has a full featured text editor and capture buffer.
It is also runable on a 9 megahertz system. Connect seems to be a bit hesitant
on a slow ST.

Drawbacks: It is no longer supported by the author, and some would argue it
was never supported. You are somewhat limited in features without the key, but
it is not crippled as badly as it could be. If you can find someone with a
key, then it would be great.

Oh, it also allows you to install various archive programs which could be
useful to unarc or arc files while you are online.

All ST User disks were damaged this month. You could send them a letter,
phone or email them at stuser@cix.compulink.co.uk. If you use email, they
only check that about once or twice a week.
The fault is (I think) that they copied a 10 sector pertrack master disk
onto 9 sectors per track floppies so that each 10th sector is missing.

MultiTOS requires less than 1MB to run and just over 1 MB of disk space.
However, on a 1 MB ST you would not have enough RAM to load any application,
so the absolute minimum is 2MB. I know because I use it.

Connect has a built in protocol that is very fast even under MTOS. It can
also use exteranl protocols like GSZRZ and XYZ. The best I've seen.
Stalker also has built in protocols.

2 Meg would be more than enough for all of the stuff you'd need for any
given Mortal Kombat level. Even with the blood and guts. There's any
number of ways of encoding those graphics to take less space and still
be usable in real-time. Mortal Kombat is a very poor example with which
to prove your point, IMHO - when you get down to it, it's trivially
simple, especially in comparison with any of the modern graphics-heavy
RPG type games, such as Ultima Underworld or Wolf3D - now *those* would
probably overrun even the 3DO's RAM.

>I'm willing to bet that Mortal Kombat as a Sega Genisis cartridge PLAYS

I have to agree with your opinion of cd-rom games. I saw one yesterday that took a full 5 minutes to load and had a 30 meg graphic startup sequence that took another 10 min to watch before you could even play the game. Not my idea of good usage for the 7 or so gigabytes of potential space. The 800 ms seek rate was not to impressive either.

That's true. But does MultiTOS need to emulate Windows 3.1 and DOS?
A lot of OS/2 is DOS and Windows 3.1. (I'm not going to say OS/2 is
better or worse than MultiTOS, but I will say I like it... :))

>Windows does true pre-emptive multitasking... that dealer should read
>a few magazine articles.
>

That's true. At least on a 386 or better... and who doesn't have one? :)

>ALL computers require a disk operating system. TOS includes it in ROM,
>the PC loads it from disk. If you're using a disk, you're using a disk

Whoa. Doesn't MS get a %-age from many PC manufacturers whether or not they
put MS-DOS on the machine or not? I really think that when you buy a typical
PC, you invariably get DOS installed whether you like it or not. Of course,
nothing stops you from buying NeXTStep, OS/2, or whatever and installing
that.

>Atari has been "rebuilding" its dealer network for the past seven years.
>It's worse today than it's ever been.
>

I dunno about that. I would have had to trek 30 min. to Toad Computers to
get one. I can now go to Chuck Levin's Music store (15 min.) to get one. :)
(we've got more music dealers to go to... but i won't be expecting good
after sale support... but then.. i don't expect that ANYWHERE!)

3850. Mortal Kombat for SNES vs. Jaguar

Source record: 201258
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just bought MultiTOS and so far I haven't been able to install it. To avoid collisions with other software, I configured my system not to boot with other auto programs or accessories (except Xboot, although I can't see why that one would introduce problems). When I double-click on the install program, it creates a window with a title and just hangs, never even filling in the contents of the window.

My machine is a Mega 2 upgraded to 4 megs on the motherboard, hard-drive software is ICD version 5.1.0. I also have a JRI genlock (supposed to be invisible to software) and an AT-Speed card installed.

Has anyone had a similar problem or any idea what might be wrong? I backed up the installation disk without any problems, so at first glance it doesn't seem like a faulty disk.

Thanks for any information.

Sounds to me like you're running our of disk space or as Erlend Nagel suggested
not enough RAM to unpack the PDF (which is a ZIP
file).

My HSC 1.40 install takes up 2.2 megs which includes some of my own source, so
you're talking at least 1.5 megs to install it I'd
say.

|> different aliens with different ships... battle tactics... customary procedures
|> etc. etc...

I like the idea of different spaceships, etc. but if it gets too much like
Wing Commander or a Flight Simulator, then IT IS NOT Star Raiders!

I want Star Raiders, having the Space View plus the space sounds makes you
feel like you are out there, with a lot of high-tech stuff alone in space, action
all the time, no time to waste - you have to destroy the Zylons before they destroy
you. I prefer this.

|> I'd like to see Space Lords type battles.....

Can you describe Space Lords?

|>
|> I'm not saying make the whole game RPG...but when you land on a planet,
|> starbase, etc. and get out of the ship... how about making your character
|> visible in a tilted perspective (la the fight scenes in the old SSI Gold
|> Box games...but yet more detailed)...where he/she could walk around, go
|> into shops... meet new NPCs with different abilities etc.

No, no and no. Again, they must do two different Star Raiders then. I guess
I'll love both, but I'll be dissapointed if they do the RPG one only.

|> But I wouldn not
|> make the RPG element (I HATE them!) a major part of the game... just a way
|> of finding out information, getting supplies etc.

NO :-)

|>
|> I meant free-flight planet battles. In Epic, when you go on a planet
|> you have free reign over the terrain. You can fly anywhere... and there

|> are land-based and air-based enemies all over the place. What's wrong
|> with this?

That part alone sounds cool. No super landing though, just destroy some
enemy bases, regain the planet and get back to space.

|> Staring at the barren vastness of space can get boring...

Nope :-)

|> how
|> about zooming through a giant starbase's exhaust port (like that awesome
|> sequence in StarFox).

That's ok, as long as you have the control and the same controls on the
spaceship all the time.

|> What's the matter with a lot of cinema displays? When you die,
|> when you blow up a major ship or target... when you find some important
|> character etc.... and when you win. Also for docking, taking off etc.

I love cinema displays but for some reason I would hate them in Star Raiders.
I remember when I turned my 8-bit on... the space was there... you are inside
all the time.. it's REAL... it seems to be real.. you are really there.

I find a cinema display a little bit distracting to that old cool sci-fi
Star Raiders atmosphere. I guess I can stand one at the very beginning and at
the very end, but not in-between.

3862. Falcon 1/0 or 4/80

Newsgroup: comp.sys.atari.st
Date: 1993-09-12 01:44:52 UTC
From: Jinlung Fung <jf4y+@andrew.cmu.edu>
Message-ID: <kgYbwIW00awHMDBVxZ@andrew.cmu.edu>
Source record: 201267

I am looking forward to getting a Falcon ASAP. However, a couple of questions popped up and I would appreciate any help.

I got the following prices :-

Falcon 1Mb no hard drive $799
Falcon 4Mb and 80Mb hard drive $1199.

Did a couple of quick calculations and it seems to be more cost effective to get the 1Mb version and then upgrade the RAM and hard drive. 80Mb is too little for me anyway, and I can fit a 300Mb in there for the same price as the 4/80. However, does the Falcon use SIMM ram and are there any hidden catches??

Are the prices above competitive??

Thanx!

3863. Connects characters sets

Newsgroup: comp.sys.atari.st

From: bill@main.morris.org
Message-ID: <26u3rg$t15@c3po.jvnc.net>
Source record: 201269

I am just wondering, how do I set the character sets in
Connect to display a true VT220 character set? I tried setting
several things, but it doesnt work. I need to be able to
display the line-drawing characters, and setting for the
VTxxx char. set doenst work, and neither does changing any of
the Gx banks (figured that setting G1 for 'graphic' would do it,
but not)

Thanx

Yes, there is a difference in term of the softwares that comes with the 1/0
vs 4/80. The SpeedoGdos and AtariWork are not included in 1/0 so you will need
to buy them seperately if you go for 1/0. They are included in 4/80.

CH> Doesn't that suggest that maybe the 16-bit bus is more of a
CH> liability than Atari would like us to think?

Interesting question. I tested my Falcon using GemBench, NessBenchmark, and QuickIndex 2.2. They all reported the Falcon to be within %50 of the data tranfer speed of a TT (I.e. ram access was about half the speed of a TT) and this with with the TT running Fast Ram. Considering that the TT is running at twice the clock speed with twice the data bus, it sounds to me like Atari did one hell of a job in designing the bus system to keep up with the 68030 cache. The machine didn't start taking a noticable performance hit until you started running 256 color VGA mode, or 640 pixel true color mode.

Later,
Gizmo

>is compatible with VT-100 implementations that are flawed.
>

I also think CoNnect is great. But, have one problem with the VT
emulation, is the graphic character set is not quite right (see a posting
I did yesterday regarding what to do).
The most important thing for me, is perfect VT220 emulation.
My LOGIN.COM on my VAX system has a $ SET TERM/INQUIRE, and quite a
bit of those VTxxx emulators out there dont deal with that. VMS knows
its a VT220.
You can also map the F-keys to be VTxxx specific, another big
problem with other terms. The backspace key can be toggled between
BS or DELETE, yet another plus when logging into my VAX...
Also, the numeric keypad is correct, in that the top row of
keys (the ( ) / *) are mapped to be the VT220 PF keys. Just right
for using EVE!

>There is only one complaint that I have seen about CoNnect. Some people
>do not like the font in medium resolution.
>

You can change the fonts... I am running CoNnect with my Screen
Blaster, in 800*600 (or close enough), in monochrome mode, and its
a sight to behold. Using this, I can leave it at the 6*6 10pt font,
and have the entire term screen in the window, without having to use the
scroll bars.
(of course, changing the font without using the ScreenBlaster is
possible, but at some point, the font gets too small to be readable)...

Yet another happy (and registered!) customer!

: MultiTOS sounds nice, my only complaint is that I can't find software
: locally for the Atari anymore. It seems somewhat pointless to have a
: multitasking envirionment with virtually no software to multitask :)

I think you have very succinctly summed up the situation with the
Falcon/ST with the above statement. You practically have to be
a private investigator to find Atari software so why even consider
buying their hardware?

Hell, Atari claims to have $35 million in cash and they are using
it ALL (per Bob Brodie's comments) to hype their game machine,
the Jaguar. That doesn't bode well for the pidgeons plunking
down their hard earned cash for new Atari boxes...

>using a SCART plug? I saw a scheme in a magazine, but before
>spending hours on fumbling with wires I would like some assurance:
>CAN IT BE DONE?

Yes, It's quite easy..... I have hooked my ST to my TV
BUT the video connection on the ST/STF and STM/STFM/STE/MEGA STE
are a bit different. On the latter you have composite video available
On the older ones this pin is only SYNC and you need to use RGB...
(and some TVs has only composite in the SCART and not RGB too..)

>Does the Atari automatically detect that a color monitor is connected?
>If so, how does it do it?

A pin in the connector is called "monochrome detect"

>Can all Atari STs drive a color monitor? Can my 520ST+?

You need to use RGB on this one (had one myself a long time ago :-)
You also nedd to do some tricks with the "12V pullup" pin
I have a cable diagram for ST+ STF and STFM if you want one

Hi Falcon-Freaks !

I'm looking for someone who wants to get in contact with me to change demos for my FALCON !

I have got a few, but that's not enough for me ! I want more and more to demonstrate these imaginary PC-Users, what a powerful computer the Falcon is.

Last week we have had a meeting for all computer-fans in our city.
I brought my Falcon with me and some powerful demos too.

Two boys came along and one of them said: "Hey, look at that demo ! It's great !" The other Boy replied: "Oooh, it's Atari ! You waste your money, when you buy this machine !"

Now it was time for me to stand up and fight....
I said: "Hey, do you know what you're talking about? Look at what I show you now!"

Some graphic- and sounddemos later, the boy changed his opinion about Atari. And when I shew him what harddisc-recording is, he was deeply impressed about my FALCON 030 !!!

OK, WHEN YOU HAVE SOME FALCON-DEMOS FOR ME, MAIL

joern@fujiyama.sh.sub.org

Thanx in advance,

Joern

I dunno. If the record company wants to have a high price on
an audio CD, whats to stop the software companies from having the
same high price?
Now, take a look at some of those 'freebie' CD software sets
out there. GNU distributes a CD with all their software, for the
lowlow price of about $100. Now, not taking anything into effect,
like what the time it took the developers to WRITE the software,
since at any time, any place, you can get most of this for free
off the net.
Go figure.

>Can anybody tell me where to get info on GDOS?
>I already have it from a.a, it seems that it is somehow related to fonts,
>but that's all I know. I haven't found a description yet.

GDOS, the graphics device operating system, is a part of the VDI that
needs to be loaded from disk -- it's not in the Atari ROMs. The ROMs
only have a screen driver and the system fonts in them. If you want to
load additional fonts or drivers for devices other than the screen, you
need GDOS, and the fonts and drivers, of course.
To use GDOS, put in in your auto folder and install an ASSIGN.SYS file
in the rood directory of your boot disk or partition. Then, create a
folder called GEMSYS and put the fonts (and drivers).
The name of the ROM screen driver is screen.sys. Your assign.sys file
should have contents like:

```
path = C:\gemsys ; path to the folder with the GDOS relevant files

01p screen.sys
myfont.fnt

02p screen.sys
myfont.fnt

03p screen.sys
myfont.fnt

04p screen.sys
myfont.fnt
```

This example assumes that you are using an ST and that you have a font
file called myfont.fnt. The numbers in the screen.sys lines indicate the
resolution: 01 = current, 02 = low, 03 = medium, 04 = high. The 'p'
after the numbers tells GDOS that the driver is found in the ROM.

>More specifically:
>I'd VERY much like to have a vt100 emulator that has the size of a
>normal vt100. For some reason no emulator uses the 'standard' text font,
>without GEM (which would be just fine with me). Somebody on this
>group suggested to you Connect with a different font. How can I
>change fonts?

I'm not sure what you mean, are you looking for a terminal program that
uses the entire screen rather than a window for displaying the terminal?
In this case, get UniTerm. One of the finest terminal programs ever
seen.

I couldn't agree with you more, and I believe almost all people actually having tried(not to mention owning one like me) a Falcon also agree with you!

> So why don't I buy a Falcon? Because it's slower than my TT. But if
> they came out with an 040 design with a TT type case, etc., I would
> seriously consider getting one. And hopefully Atari realizes that
> there are people who are looking for something with competitive
> speed.

I doubt that the Falcon is aimed at TT-owners, when it comes to running normal ST-programs not using the DSP the TT clearly outruns the Falcon (why shouldn't it at 32MHz?) and the TT is more expensive... The Falcon is aimed at ST/STE/MSTE owners wanting to keep up with technology and also being able to run some lovely games and DSP-software when it starts appearing... Surely Atari has plans for a Falcon040 (why call it "030"???) packed in a sleek new TT-style casing with separate keyboard...

3883. LEXICOR SOFTWARE Internet Support

Newsgroup: comp.sys.atari.st
Date: 1993-09-13 00:20:12 UTC
From: drnibble@bigwpi.WPI.EDU
Message-ID: <270ebs$kt6@bigboote.WPI.EDU>
Source record: 201202

Hi everyone in the Atari Platform

Lately I've been getting a lot of mail from Internet User's who have questions about Lexicor Software Products and their Support.

Please, if you have any Lexicor related questions email them on Internet email them at Lexicor@world.std.com or on delphi at LEXICOR or LEXICORWORLD@delphi.com or 75300,763@compuserve.com.

Thanks a lot

Yat Siu
drnibble@wpi.wpi.edu

Lexicor Software Products listing:

Chronos-3D the 3D Key frame animator for every ST/TT or Falcon which allows 3D Morphing and Cycles for very realistic movement.

Phoenix-3D (or Xenomorph-3D in Europe) the very fast and realistic Object Renderer with marble, Image, Wood, Color Splines etc. Textures for every Atari System upto 24bit.

NOVA Graphics Card, the 24bit System for every Atari System, from your regular ST to a TT (no falcon though).

Prism Paint II, the newest animation tool for Atari User's, support every Atari System with animation and over 113 Functions, Printer Support, Scanner Support and Modular External Programming Ports.

OUTSIDE, the Virtual Memory Program (in U.K. and U.S.A.) for all '030 Atari System's

Averkey for direct Video Output and Professional DTV on your Atari with either Falcon or NOVA Systems.

Raystart, the new Raytracer for every Atari Platform with an easy GUI Interface and Textures etc.

etc. everything for the Graphics Sector for Atari..and more

LEXICOR SOFTWARE CORPORATION
1726 Francisko Street
CA 94703, Berkeley
U.S.A.
Tel: (510) 848-7621
Fax: (510) 848-7613

For Internet User's please email: Lexicor@world.std.com

3884. Winx -or- TOS from disk (and a minor announcement)

Newsgroup: comp.sys.atari.st
Date: 1993-09-13 00:30:02 UTC
From: sourada@iastate.edu
Message-ID: <sourada.747880202@vincent1.iastate.edu>
Source record: 201203

Winx sounds like it make some interesting improvements to GEM, so I'm curious about it. The only problem is, I can't seem to get it to work for me. I have a 1040STe with (American) TOS 1.62. Winx will load the TOS from ROM and modify it without complaint, and write a file to disk that is presumably a TOS image. But I can't find any way to get any further than this.

Gemram 1.1 will not recognize my TOS, quicktos will not load the image file (it gives me 4 or so bombs when it tries), and I don't know of anything else to try.

Any hints?

Thanks,
Steven Ourada

P. S. This is a minor announcement that has nothing to do with the above. I've compiled p2c, a pascal to C translator, for the ST's, and it seems to be running. As far as I know, the combination of this and GCC or Sozobon/HSC is the only freeware way to compile Pascal on the ST. Look from p2c at atari.archive soon, if you're the kind of masochist that uses pascal :-)

3886. WINX 2.1

Newsgroup: comp.sys.atari.st
Date: 1993-09-13 02:12:00 UTC
From: Martin_Osieka@wi2.maus.de
Message-ID: <A4361@WI2.maus.de>
Source record: 201340

Last week I distribute a new version of WINX: 2.1. Please have a look at it. You can find WINX21.LZH at ftp.uni-kl.de or atari.archive.umich.edu (May be you need GEMRAM15.LZH too) Here's a short excerpt from the docu:

WINX expands GEM of TOS version up to version 4.04 to some of the features which also are usable in MultiTOS. From users point of view this is (among other stuff) for example more windows, control elements for background windows and an expanded user interface (this relates to the usage of control elements). Additionally some bugs and deficiencies of the different GEM versions have been removed or repaired and expansions have been built in. A very developer friendly function is a mode to let WINX check for improper calls of the AES window library.

Theoretically, ALL 'clean written' 'well-behaved' GEM programs should get along with these changes easily, but the practical side is slightly :-) different. Even TOS internal GEM Desktop had to be changed for some reasons. Please be sure, that if one of your programs will have several problems with WINX, it also has very good chances to have problems with MultiTOS, too. It would be a good idea to give a hint to the authors to test the program with WINX and to let them get into contact with ATARI to let them be informed how to legally get MultiTOS for testing purposes.

WINX will integrate an expanded user interface into GEM if the TOS version is greater than 2.xx. This changes the way of mouse usage: Starting with this version of WINX, both mouse buttons can be used to select the window control elements. The right button will induce action, that is started after release of the button. If the left mouse botton is used, action is performed immediately and as long as the mouse button is not released again. You can recognize this state by a change of the mouse form: The arrow looses its shaft. A good example for this is the moving of a window. If you select the move bar of the window with the right mouse botton, then a frame is drawn which can be moved to a different position. Only after releasing the mouse button the window is redrawn at the new position. If you use the left mouse button to select the move bar, the window is redrawn constantly just where the mouse moves. The same behavoiur holds for the usage of the sizer, closer, full-size box and scroll bars.

Action started by klicking the scroller arrows of into the scrollbar did not change. They already and always leaded to direct response of the program. Aditionally, a clicking on the scroller arrows with the right mouse key sets the scrollbar to the start

(or end) of the scrollable area. If you click into the scrollarea, the scrollbar is directly put to this position.

Another new feature is an addition for handling a click on the title bar of the window. Up to now, this could only top a background window. Now it also is possible to backdrop windows, if a program can already handle the newly defined message.

The CONTROL key is a modifier for actions which are performed by clicking window control elements. If CONTROL is pressed while the mouse click is performed, the normal meaning of the control elements is lifted away. Instead of this, the window is put into front or background. This is very useful if a window is only partly visible.

If CONTROL is pressed while the right mouse button is released, the action that SHOULD be performed is ignored. For example if you started to move a window, but then again prefer to leave it at the previous place.

Known Bugs:
Programs linked with old TurboC GEM libs may have problems if they use USERDEFs in menus (fixed in next version).

Send bug reports to Martin_Osieka@mtk.maus.de.

cu Martin

3887. PI Calculation

Newsgroup: comp.sys.atari.st
Date: 1993-09-13 03:11:47 UTC
From: slyster@outb.wimsey.bc.ca
Message-ID: <slyster.07rl@outb.wimsey.bc.ca>
Source record: 201244

Just a word to those writing PI programs:

Warwick Allison of Brisbane, Australia, has rightly pointed out that the 1st Borwein & Borwein algorithm should have as its third iteration term....

```
p(n)*b(n+1)*(1 + a(n+1))
p(n+1) = ----------------------
1 + b(n+1)
```

rather than then b(n) in the numerator, as I distributed before. If it *is* b(n), then because b(0)=0, then p(n) = 0 for every value of n.

If it is b(n+1), then p(n) converges on PI, as a quick check with a hand calculator will show.

Thanks to Warwick for pointing this out. I will be writing to the author of the study from which I got the formula pointing out the error.

Take a gander at what George did spout on 10 Sep 93 ....

GC> True about the space requirements ... I saw the WindowsNT
GC> distribution package at CompUSA the other day (I was buying generic
GC> diskettes), and the minimum requirements were 70 Megabytes of disc
GC> space and 12 Megabytes of RAM. That's just to get started.
Terrible isn't it! All that Object Orientated programming....

GC> the dealer points out that MultiTOS does true multitasking, in that
GC> all applications get a share of processor time. Apparently,
GC> Microsoft Windows doesn't have this feature.
GC>
Well to be fair here I think Windows NT does true multitasking though it does
cane the platform it is running on (not quite as bad with Multi-Tos I am glad
to say).

What made me laugh was the spec sheet for the new wonder chip The Pentium,
Dirty cache handling introduced..... Pipelining introduced.....
These are all items the higher end Motorola's have had for ages!!
In an ideal situation I would have an efficient operating system running on a
well designed, efficient microprocessor.
We live in the real world so I will stick with my ST for the moment (at least
until the Power PC's make an appearance (efficient processors with inefficient
operating systems?)

Grr. FLAME-ON:
Sheesh. Atari bothers to exist you moron, because there are people out there, unlike yourself, who actually support a good machine when they see one. And the music industry tends to use Atari systems for midi productions more than, say Apple Macs and Commodore Amigas. PC's are not even in the running.

In the same line I *could* say 'why does Apple bother to exist?', but I won't, because again, there are people who support the Mac.

BTW, are you by any chance a Mark Barrett wannabe?
You sure act like one you twerp.

If you have comments in future, activate your brain before you post!
And at least *try* not to show your incredible bias!
FLAME-OFF.

To all the others out there, I apologise for the wasted bandwidth, but this just *asked* for a flame.

Message-ID: <271cp9$ggd@miriel.iwb.mw.tu-muenchen.de>
Source record: 201214

Hi folks!

today I've released the new version of Kandinsky. It's version 1.54 (09/12/93).

You can find it on 'ftp.e-technik.tu-muenchen.de' in 'pub/comp/platforms/atari/incoming'.
There are three packages: kand154d.zip, the German version,
kand154e.zip, the English version and
trpd054.zip, a 3D-Editor (creates GEM-Metafiles).
For each package, there is a short description in the files kand154d.idx, kand154e.idx and trpd054.idx.

For those, which even don't know Kandinsky: it's a beautiful application for editing and creating GEM-Metafiles. Kandinsky likes SpeedoGDOS, MultiTOS (or Mag!X, MultiGEM) and the clipboard.

bye, Uli

Using the ATARI System Font this is not possible. You'll need a
font that has an ANSI Character set like TMAIL-ANSI or the CoNnect
Fonts. Those fonts are GDOS fonts which you easily can install
in the usual way if you run a GDOS or which you can make available
to CoNnect even without GDOS when you put them in the folder
GEMSYS in the CONNECT - Folder. (This should be explained in the
Online Help anyways ;-)

JG> In the game Chaos Strikes Back, in the Diabolical Demon Director,
JG> how do you get passed the pit that's blocking the way to the door
JG> marked ROS? I've gotten to the KU, DAIN, and NETA doors...and I'm
JG> assuming the ROS door is on the other side of this *(%@&(#$ pit!
JG> Please email me if you know!

It's really very simple.

You must get on the side of the pit where the stairs are (same stairs for the NETA-way) Go DOWN these stairs. Open the gate by killing a skeleton behind the door. Now hold up ANY item you picked up in the ROS-part of the maze in front of the eye. Then the pit closes and you can finish the ROS-way (and the game...)

See ya!

I am thinking of buying an Epson GT6500 A4 Colour scanner, which I have seen reviewed very highly, to connect to my Falcon but I have a couple of queries about it -

1/ Does it have single or dual SCSI ports? This is very important to me, since my SCSI hard drive (a Datapulse) has only one SCSI port, so I can't daisy chain them unless there is an additional port on the scanner. If it has only a single SCSI port, how much does the scanning performance suffer if it is connected in an alternative manner?

2/ What SCSI device numbers can it be configured to?

If anyone has experience with this scanner, and the associated 'Look' scanning software, or has an alternative recommendation with similar capabilities then please get in touch.

Cheers

- Andy.

3904. SST 68030 board

Newsgroup: comp.sys.atari.st
Date: 1993-09-13 11:08:00 UTC
From: Arne_Rudolph@ac.maus.de
Message-ID: <A12013@AC.maus.de>
Source record: 201346

Are there any users of the Gadget's by Small SST 68030 board out there?
I have been trying to reach Gadget's by Small for several months now, but I always ended up talking to n answering machine. Although I left my telephone number and although I even sent a FAX, nowbody ever called back! I would like to know, if there is a newer version than 1.86 of the software around, or if Gadget's by Small would give the sourcecode away (disassembling it is quite a task).
Anyway: I would like to get in contact with other users of the SST board!

BTW: I would like to get in contact with someone from the New York area, too! Why? I _desperately_ need information about car prices over there (and some hints about buying a car in the U.S.A.).

Ciao,
Arne

If it helps, I have a Falcon. I also know of 4 other people who have one. Given a finite number of aquantencies, that's reasonable.

The Falcon *is* selling. It *is* being supported. There *are* many 3rd parties producing stuff both hardware & software.

When will all you US/Antipodean people realise that just because the Atari is dead in your neck of the woods, it isn't the case elsewhere.

Additionally, there is much fine PD for the Falcon. Art packages, graphic & sample players/converters and all manner of nice things.

I need to keep re-arranging my HDs (65Mb+380Mb+48Mb) Because I'm so pushed for room
and everytime I buy something new it's a squeeze. If you want some software so
badly, try getting it mail order.

Currently I'm mainly using Superbase 2, Lattice C, Ghostscript, DevPac, TruePaint,
Wordwriter, 1St WordPlus, That's Write, Timeworks DTP, Cixcomm and mounds of PD and
utilities as well as hardware like BlowUp030. When I changed from MSTe to falcon,
the only thing that would no longer run is VIP Professional.

What software won't run on the Falcon? I can run pretty much all my ST stuff on it fine and most games too using backwards.

Lattice C gets a bit strangte under 4.01 but is fine under MultiTOS as it's the AES problem.

From: mkite@lincoln.gpsemi.com
Message-ID: <CDAL5L.HA0@bailgate.gpsemi.com>
Source record: 201223

Hi,

I just bought a second hand Mega STe with a DD(720) internal floppy drive.
Now I know the last Mega's had HD(1.44M) internal floppies. Anyone know
anything (like how, where from(UK), how much ...) about upgrading the
internal drive ?

Thanks,

Martin

3911. SCSI Tape drive on the ST

Newsgroup: comp.sys.atari.st
Date: 1993-09-13 12:29:22 UTC
From: mkite@lincoln.gpsemi.com
Message-ID: <CDALCz.HB3@bailgate.gpsemi.com>
Source record: 201222

Hi,

I've seen a few things about the possibilities of using SCSI tape drives with the ST range for hard drive backup. Does anyone have any experience/warnings/ advice on this. Also - could I use a SCSI tape drive to transfer files to and from a UNIX system with this setup ? (OK it's a bit extreme but for gifs etc DD disks at 3 to 4 pictures a disk is a bit of a hassle :-))

Thanks,

Martin

The .PAX format is part of the GEMView installation version. There should be a program called GEMVINST.APP, which unpacks the .PAX-archives automatically. If this program doesn't exist look at ftp.tu-clausthal.de in the /pub/atari/graphics/viewer directory.

Hope this helps,

Chris

<shake>

Ok, sounds fine. As an Atari owner, I realise that 'released' usually
means 'available in 4-12 months'... :-\

Really, I'd be ecstatic if Atari released a Falcon040 machine (well, I'd
also be incredibly annoyed if they crippled it with a 16-bit bus and
that hellish case/keyboard), even though I'd be out ~$60 or so.

>'Falcon software' (including AFM, D2D, etc).
> Also installed is the ScreenBlaster software, plus a few
>other choice programs.
> All this, and its taking up less than 20mb.

My guess is that he included the space taken by the language disc, MTOS, and SpeedoGDOS in his estimate only, since the other programs can be considered applications and not operating system programs. ...And I'll bet he guessed higher rather than lower, just so the Atari would look even better on closer examination.

>>of RAM (according to my local Atari dealer), and that's allowing for
>>a "lot" of RAM to run a "lot" of applications. BTW -- the dealer points

Windows DOES NOT do pre-emptive multitasking. The only way to make windows even do co-operative multitasking (such as that used by Borland's C++ compiler under Windows), is to make a call to the Yeild function so that any other tasks waiting for execution then get control of Windows. There are some other functions that are involved in this, but the point is that it only can handle co-operative multitasking.

For the most part, Windows is a single tasking Operating System built on top of another single tasking OS (DOS) that normally only allows task switching. Yes, it is becomming the single most popular pieces of software in history, but that is no reason to claim it has functionality that just doesn't exist.

Gasteiner in the UK can upgrade the drive very cheaply using official Atari
bits. Otherwise just shoehorn in any old 1.44 and set dipswitch 7.
I'd have thought even the official drive wont be much more than 50GBP.

The new version of Diamond Back (3?) will handle SCSI tape drives no problem. Otherwise you should be able to use the TAPEBIOS stuff to cobble together some kind of driver.

Tar is available for the ST so you can use that on Unix to write/Read tapes.

From: sourada@iastate.edu
Message-ID: <sourada.747935248@vincent2.iastate.edu>
Source record: 201235

Since there is evidently some interest in the ST port of PGP lately, I'll put the diffs on atari.archive. I'm hesitant to put the binaries anywhere because of the cryptography export restrictions. So I'll leave it to anyone who wants PGP for the ST to collect the sources and diffs and compile it up themselves, taking all responsibility into their own hands.

Also note that in some future version these diffs will be incorporated into the real distribution.

We haven't moved to *.advocacy because it's not available to BobR
(if I remember right....)

In article <90237@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
>A minimum installation of OS/2 requires 20 Megabytes of disk storage.

We aren't discussing minimum installations. We're discussing
complete installations. (That's like the difference between a merely
"decent" '486 and a '486 that is able to give Falcon-like performance,
a discussion that's already been discussed over in *.advocacy :-)

>MultiTOS takes a LOT less space because MultiTOS *does* a LOT less.

Since I haven't used MultiTOS yet, I can't reply to this comment.

>Windows does true pre-emptive multitasking... that dealer should read
>a few magazine articles.

My dealer _also_ sells MS-DOS machines, and invests the time to
stay knowledgable on the technical details of both systems.

>ALL computers require a disk operating system. TOS includes it in ROM,
>the PC loads it from disk. If you're using a disk, you're using a disk
>operating system, true, but on a PC it's not necessarially MS-DOS. (You
>have a choice).

True, there is a standard operating system that ships with *every*
Atari. It's also true that you can get alternate operating systems
(OS-9 springs to mind) that will run on the Atari. I see discussions
of alternate file systems on other threads in this and other Atari
groups, so I can assume there are a few more....

>Atari has been "rebuilding" its dealer network for the past seven years.

Persistant, aren't they?

>It's worse today than it's ever been.

At the San Diego Computer Fair this last weekend, Atari had a booth
showing the Falcon to an estimated crowd of 20,000+ attendees. They
had a musician in the booth composing an upbeat melody by randomly
selecting passersby (kids age 12 and under seemed the bravest and most-
willing) to add tracks to it. (I think they were using SMPTEtrack as
the software package to drive the system, but I'm not certain.)

The demo was so impressive and so well received that the area around the
booth was jammed by people who were standing & watching/listening, and the

Falcon flyers vanished into eager hands. The local dealer had to bring
more flyers from his shop to replenish their supply. This sort of
interest was not evident at the Microsoft booth or at the OS/2 booth.

Based on this, Atari is:
A) Actively marketing to the end user,
B) Actively supporting their existing dealers, and
C) Being actively supported by their existing dealers.

With this kind of support, there will be more dealers in the future.

>The Jaguar was brought up because Atari has virtually abandoned the Falcon
>already, putting (according to Bob Brodie, just to satisfy Warwick's
>curiosity) all its resources ($35 million, down from the $50 million
>they said they had to launch the Falcon) toward launching the Jaguar.

It that were true, they wouldn't have been at the San Diego Computer
Fair, actively demonstrating only the Falcon!

Ouch! After I've loaded MultiTOS (i.e. MiNT, new AES, new Desktop) I have about 500K left on my 2MB machine. Where has all your memory gone?!

Does SpeedoGDOS take the other 2MB?

I was under the impression that Windows does *not* do pre-emptive multi-
tasking for windows applications. It depends on them making Windows calls
to get a look-in -- try running a meaty analysis on SPSS (a stats package)
for Windows and see it lock the screen as it makes perfunctory Windows calls
every few seconds.

No! Thats not true. Windows MultiTasking is NOT pre-emtive. I am
suprised you don't know that. OS 2 and NT both support pre-emptive
multi-tasking. Windows does not. (Windows 4.0 might I suppose, but 3.1
deffinately does not).

In article 42s@freenet.carleton.ca, ah977@Freenet.carleton.ca (Allan Sullivan) writes:
>
>Can anyone recommend a good manual for GFA Basic? I have Version 3.5
>(The version which came with ST Format last year; once I become comfortable
>with GFA, I'll probably buy the compiler.)

Unfortunately, there are not a lot of good 3rd party reference and/or tutorial manuals for use with GFA BASIC, regardless of its unending popularity.

For 'raw recruits,' the book 'GFA BASIC Training and Reboot Camp' by D.A.Brumleve and published ages ago by Michtron was pretty good but now long out of print.

GFA also published several books of its own, 'The GFA BASIC Book,' 'Using GFA BASIC', 'GFA Software Development,' etc. These were all translated from the original German and most were fairly narrowly focused at the Intermediate to Advanced programmer. I doubt much in these pages would be of help to you but some are still available directly from GFA. Call 1-800-766-6GFA for info.

Taylor Ridge Books published 'The GFA BASIC Toolkit-Volume I' this year and is a collection of routines and functions you can merge with your own programs. While not a tutorial, you don't have to be an experienced programmer to make use of the routines and studying the source code (printed and on disk) is always a good way to start. Taylor Ridge's phone number is (203)643-9673. I compiled the book so I _may_ be just a bit prejudiced here. Nah... :)

There are two public domain downloadable text files available on GEnie (and perhaps via ftp?) that deal with GFA programming. The first is quite old and was written as a beginning tutorial for GFA BASIC 2.0 and is called 'GFA CLASS.' The second is much more valuable, IMHO, and is called 'GFA EXPERT' (sometimes referred to as 'Your 2nd GFA BASIC Manual' and was written by Hans (can't recall his last name) of The Netherlands. Although not a tutorial, it is full of good info and well worth the download. Another download consists of most of the GFA manual that shows command syntax and is available from the GFA editor as an ACC. Sorry, I don't recall the author's or download's name. Search on GFA.

Another way to learn is to study other's source code. Download any files that include GFA source code and try to figure out how they work. That's how many programmers (using any language) get started.

But... if you are using the ST Format cover disk version and do not have the actual GFA manual, you'll never get very far, IMHO. There are some 700+ GFA commands and reserved words so do yourself a favor and buy the manual first. If not available from your dealer, you can get it straight from GFA in the US.

I'll be happy to try to answer any GFA programming questions you may have... once you have the manual, of course. :)

Hope this helps.

How much does a Falcon 14/0 cost? 4MB is just not enough if you want to do heavy gcc work. But although supposedly the Falcon will handle 14 MB, it is supposedly also not expandable through normal means. Is there a card slot of somenthing that you install a 14MB card? The Falcon obviously does not have SIMM slots.

(Actually 4 would not be too bad. But 14 would be much nicer).

Don't know which CD-ROM game you were referring to but 'The Journeyman Project'
for the Macintosh is typical of a truly great game idea gone bad in its final
execution. Graphics, sound, and game play are phenomenal... but so is the
wait between loading new graphics and sounds! It's so slow as to be nearly
unplayable. But fortunately it is not typical of all CD-ROM games, as many
utilize disk caching schemes which make game play quite reasonable. It's
still a maturing technology, IMHO.

If anyone in the US wants a free copy of the Cyberdrome-Hoverjet Simulator demo that Atari ST User put on their (evidently) screwed up cover disk, just send a blank disk and a self-addressed-stamped-envelope to:

Fair Dinkum Technologies
P.O. Box 2
Los Alamos, NM 87544

Make _sure_ you include a blank disk and sufficient postage, OK? Otherwise, it's also available for download from GEnie or ftp from umich, I believe.

I encourage our European friends to contact ACN (Atari ST Nieuws) in The Netherlands for a copy of the Cyberdrome demo or the full commercial product.

Cheers,

>
>

Well, I haven't tried the SNES Mortal Kombat yet but I did rent a
Genesis and Mortal Kombat over the weekend (I got it early too). I was
generally disappointed with it but I might have been expecting too much
as I am an avid Mortal Kombat fan from the arcades. Here's a few things
wrong with the Genesis one:

It just does not capture the feel/timing of the stand-up. This
could partly be because of the Genesis controller that I was stuck
with, see below.

Very jerky animation (must be missing several frames of animation)

Hard to control (this one could be the fault of the standard
Genesis crappy controller, it seemed that I could hardly ever get the
straight directions up, down, left, right when I needed them; I would
end up with a diagonal instead) Although I thought they did a good job
with remapping the 5 buttons of the arcade to the 4 buttons of the
Genesis. I have yet to get Kano's fatality to work (I got all the others)

Almost none of the samples are there other than Scorpion's
'Get over here'. Everything else gets a generic grunt or something
substituted in its place. I really miss Lui Kang's thrust-kick scream
and Raiden's torpedo scream.

The images used for the fighters facing left are just mirror
images of the fighters facing right instead of actually seeing the
other side of the fighter (this trick is not used in any of the
stand-up fighting games).

After each game I have to wait for several minutes to get to
play again if I don't continue (I think it is kinda wrong of them to
let you press start to get past the 'Midway' logo yet you have to sit
through 'Sega', 'Arena', and 'Probe' for a long time, did I forget one?)

This is not necessarily a bad thing but I was getting Reptile
appearances out the ying-yang and have never seen him at the arcade
(still haven't fought him yet on either Genesis or arcade)

In closing I will just say that this is no substitute for the
arcade version. I will rent a SNES and its version soon to see how
it compares to the Genesis and arcade, until then ....

3939. MSX formatter wanted!!!!

Newsgroup: comp.sys.atari.st
Date: 1993-09-13 17:49:53 UTC
From: hallvart@ifi.uio.no
Message-ID: <1993Sep13.174953.25928@ifi.uio.no>
Source record: 201249

Does anybody know of a program that can format MSX DOS disks on the Atari ST?
I'm not referring to MS-DOS.
All I know about the MSX-DOS system is that the disks are 720K 3.5" DSDD and my Atari can read the directory of those disks, but my sampler (Yamaha TX-16W) which uses that particular format can't read TOS, or even MS-DOS formatted disks.
It would be a great help to get hold of a program that at least formatted MSX DOS, but even better would be if the program could copy whole disks and single files in addition to formatting.

I dunno. All I know is that the eggheads who put all this stuff together are in a constant search for the *algorithm* that converges on PI the *fastest*.

The issue is not that it will work (which I am assuming PI = 4 * arctan(1) will do), but are the other expressions of the 'arctan' method *faster* in convergeance.

From: slyster@outb.wimsey.bc.ca
Message-ID: <slyster.07so@outb.wimsey.bc.ca>
Source record: 201138

So far I have received one PI program that DOES calc PI, but does not as of yet meet the rules of the competition.

I will not reveal the name of the entrant... he advises me that he is working on one that is approx. 25% faster than the following trials...

/* 'Spigot' algorithm originally due to Stanley Rabinowitz */

Digits of PI requested Time

100 1.55 seconds
1000 2 min 3 sec
10000 3 hr 20 min
(estimated) 25000 27 hr 36 min 15 sec
(estimated) 48370 113 hr 52 min 15 sec

The 48370 is the 'limit' of what the program will accept when run on my computer.

BTW - please note that a TRS80 beat a Cray SuperComputer in a sorting of 50,000 numbers, because the TRS80 had the better algorithm. In this business, the algorithm *IS EVERYTHING*.

So far as I know, the Borwein & Borwein algorithms converge the fastest - hey, mebbe even this humble 8 MHz ST of mine will one day take on a Cray!

Sadly enough, that describes a large portion of the ST software available.
Atari does have some of the best PD software for any platform,
Unfortunately much of the PD stuff falls into the badly written category
(ie. poor programming techniques)

Hi!

From the english magazine "ST Format" did I got a playable demo of CIVILISATION. I want to play it on my Falcon but there seems to be a bug with the colors. Does anybody know anything about this?
(I think I read some information in the last months, but I killed the messages.)

In "ST-Format" did I also read that there are some Patch-Programs for STOS-Basic available which makes it running on a Falcon. Any information available?

Greetings,
Christian

>B> How do you increase the clock speed 100% and gain a 200% increase in
^^^^^^^^
INCREASE. Not 200% of standard performance... but 200% INCREASE over standard performance... to me, that's the same as saying a total of 300% performance-- but I'm sure my math is no better than Bobr's.

I guess I'm just an idiot.

I also hate it when those commercials are for something that has 25% of something removed/reduced and they say:

75% LESS blah

Shouldn't that be illegal? If you start out with 100X's and you end up with 75X's ... you most certainly do NOT have 75% less X's. Likewise... if you start out with 100% and you end up with 200%, you do NOT have a 200% increase.

Where is my calculator...

The SNES version is perfect in terms of timing. I've played it repeatedly,
and the only flaw in it as I see it is that it is a little too easy for me
to get through the whole game with Scorpion. Also I hate the control pad, but
they do have more buttons than Sega so they are more faithful to the original'
feel.

The lack of excessive violence is compensated because they keep the feel of
the coin-op.

>
> Very jerky animation (must be missing several frames of animation)

The SNES version is solid in this area.. .I can tell the difference in that
the arcade has more detail, especially in the background but the colors and
speed feel about right.

>

All of that is in the SNES version.

Anyways, to make this point relevant to the Jaguar thread... I think after playing this SNES game, the hottest genre seems to be fighting games. I sure hope Atari is paying attention to this trend because as much as I'm going to love finally being able to play Tempest at home, I really feel that they will need something akin to SF2 or Mortal Kombat to sell machines.

>same high price?

The "same high price"? You mean $16? Give me a break.

The point of CDs is that you can fit a program on ONE CD. That CD costs the software company about $3. A lot of new software would require 20 to 40 HD disks, which cost the company probably $0.30. So if it going to take more than 10 disks, the software company can cut its costs.

The cost of the software to the user is going to decrease accordingly. Just remember, most of the software cost is just for the novelty of the software (i.e. the programming, profit, etc). Somenthing that costs $499 might fall to $459 on CD. It is not going to fall to $16 a disk. That would be ridiculous. The point is, you save a fair amount by getting it on CD. (Go look around. The trend is already starting. You can get OS 2 cheaper on CD. That doesnt mean they are going to start selling them dirt cheap, just that the extra packaging costs will dro.)

(So maybe OS2 is a bad example, but I cant think of any Atari program that takes more than 8 MB. Sorry! Eventually, there will probably be software on CD for Ataris as well.)

3951. Midi filer for the ST

You need the new Floppy-Disk-Controller (can't remember the name)
for a start, BUT you also need a board-revision with a small strap
next to the 68882-socket. I didn't have that strap, and then I
couldn't enable 1.44 MB and had too change the whole board :-(

Message-ID: <slyster.07t4@outb.wimsey.bc.ca>
Source record: 201136

Just in case you thought I dealt in only *useless* information, try this on for size....

In that test prog to calculate PI...

Because doubling the requested number of digits to calculate produces a 3.88 times extra computational burden on the program, and since it takes only 1.55 seconds to calculate 100 places with it... consider that...

To match the 1961 record of 100,000 digits on the best computer then available with the best known algorithm would take 17 days 4 1/2 hours.

To match 1986 record of 29,360,000 - 3,000 years.
Current record of over 200,000,000 - 80,000 years.

Geez... if I start now......!

And the screen RAM? And the program? Not a chance.

>There's any number of ways of encoding those graphics to take less
>space and still be usable in real-time.

Not really. Mortal Kombat is a good example here, because it uses
real-world scanned images (what a cop-out, eh! artists of the world rebel!)
which are much more difficult to decompress at high speeds, and which
contain more colours than you would expect in a hand-drawn image.
10 actions time 5 frames each time 2 players times 32K per frame
is 3 megabytes. And there are more than 10 actions, more than 5 frames
per action and more than 32K per frame (eg. 128 pixels by 256 pixels at
1 byte per pixel), so that 3M is a CONSERVATIVE guess.

To get Mortal Combat graphics into 1.5M (ie. leave room for code and screen),
you'd have to cut corners. With 14M you wouldn't have to, in fact, you could
do a BETTER than arcade-quality game. Of course, ROM isn't free either.
... but it's nice to have the choice.

>

I seem to remember that Kano in the arcade has his metal side showing _ALWAYS_ (I haven't checked but I am pretty damn sure) As far as I can tell most games does this mirror flip (why make two pictures when one will suffice, save the memory for more important stuff) Just to carry this further think of DPs in SF2, on the left side it is the right fist in the air and vice versa on the right. Don't gripe if it ain't worth griping about.

By saying PTXXXX do you mean the PTC1426 Monitor from Atari? That Monitor is capable of displaying in True Color (24bit) and High Color (15/16bit) at 640x400...if you were referring to another monitor then just disregard this post ;)

It is NOT capable to display that 640x400 in High Color via the Falcon. But through a True Color System eg. like the NOVA Graphics Voard or SUperNOVA it can display that. Of course..the NOVA doesn't run on the Falcon yet :)

Umm.. actually that particular discussion WAS minimum installations.

Someone said that OS/2 required a much higher amount of disk space, even
for a minimum installation. My reply of 20 MB was in reference to that.

Are you certain it was Atari Corp. who put on the show at the San Diego
computer show..?

Atari is famous for leaning on the efforts of local computer users groups
to put on shows. Was this an Atari exhibit, or did SDACE do all the work?

Both MACE and WAUG (in my local area) have put on similar exhibits at
generic computer shows, trying to expose more of the general public to
Atari computers.

Putting on a show is far different however from supporting a dealer network.

So far the only thing Atari has demonstrated is their ability to destroy
a dealer network, not support one.

With every new product, there have also been promises of a new effort to
rebuild the dealers... it's never happened.

3962. Re: TT video

Newsgroup: comp.sys.atari.st
Date: 1993-09-14 01:31:51 UTC
From: Lexicor@world.std.com
Message-ID: <CDBLL4.M44@world.std.com>
Source record: 201322

Regarding your questions:

The TT in 640x480 will run on any VGA monitor, however you will get a strangely compressed signal ;) so ideally the PTC1426 can with a switch in the back expand the picture to full size, however overall it's not a good monitor, I'd suggest to get a 3rd Party Gfx board and get a good Monitor.

1280x1024 can be achieved on a TT only thogh 3rd Party Graphics Boards eg. like the Matrix or NOVA, CRDOT's etc. depending of course if you are looking into displaying that rez in color, or monochrome.

Theoretically if you wished to buy a gfx card, and 1024x768 NI Monitor can display that rez..interlaced however..you would need to spend a lot for a good monitor.

The TT High rez in 1280x960x2 requires the TT High Specific Monitor, I think it was called the TTM194?

tw..what is your application? maybe that could help :)

Sincerely

You want to mess aroundto display "True Color'" on your Falcon on your VGA Monitor at 640x480? I'd be interested to know what your results are..

In VGA Mode "True Color" is only displayable at 320x480, however if I am correct, hardware converters are available to display higher resolutions on a Falcon with "True Color" eg. like Blow Up'030. In the "MS" modes it appeared to be able to have the option "True Color".

I think the highest it can go is 448x544 in the "TC" mode...anyone have more experience on Blow Up'030?

I recently deleted my only copy of the compiler for GFA 2.0! Can anyone help me with info or whatever? I'm in the middle of a lengthy program, and need help fast!

Also, I recall there being an Atari achive in Michigan. Can someone send me the address? Thanks much anyone!

Hmm... for some reason this didn't get posted the first time...

Anyhow, I've recently completed a version of a program that launches several programs (TOS or GEM) of your choosing at boot time. I've tried to post the UU encoded versions to comp.binaries.atari.st but my mail-deamon says that the current moderator is extinct. How do I post these programs?

BTW- Thanks to Jan for answering my GDOS questions! :)

R$E: SNES MK vs. Genesis MK

Are you kidding about the timing on the SNES version? It sucks!
It's nowhere even close to the arcade and combos are nearly extinct. And
the Genesis version looks so sad I couldn;t tell WHAT I was doing...

Let's face it folks, and quit trying to justify the $60 you spent.
The Mortal Kombats SUCKED. ALL FOUR. Arcade puritans will agree with me
110%. I was lucky to sell both my copies (Genesis and Gameboy) while the
hype was still high, try the SNES one, and sell *it* too!

Acclaim: read this loud and clear: those translations SUCKED. I
can only cringe at the thought of what you're doign to NBA JAM.

|>When you start Pure C from the desktop, shell_p is not set,
|>so it is impossible to use the shell escape. If you start from
|>within some shell that sets shell_p, the shell can be called.
|
|After a private discussion with Patrice we wonder whether the following
|should be possible: write a small TSR that installs a shell_p routine
|which simply Pexecs "/bin/sh" (or according to an environment variable,
|the default shell). Then you'd be able to call your shell even when PC
|was started from the desktop.
|
I have tried that and it did *partially* work, but it can be
that I did something wrong. I could run the shell three times,
the fourth time the system bombed.
If I remember well, the trick is to put a branch instruction
in the shell_p variable (four bytes are exactly enough) to the
routine you want to execute. You do that while initialising the TSR.
Every time you call the shell escape from within TC or Pure C,
the branch is done, and the routine is executed.
I wondered also whether it would be possible to run a different
shell in Gemini this way (I want to run a version of ksh for plain TOS)
but for some unknown reason that did not work at all.
Any suggestions on how to fix these problems are very welcome!

marc(@targon.UUCP)

> A minimum installation of OS/2 requires 20 Megabytes of disk storage.
>
> MultiTOS takes a LOT less space because MultiTOS *does* a LOT less.

MultiTOS does all the OS-functions of Windows, OS/2 and the rest, the
difference is that you don't get loads of extra-programs along with it...

> Windows does true pre-emptive multitasking... that dealer should
> read a few magazine articles.

Try reading a few articles yourself... Windows does NOT offer pre-emptive
multitasking of windows-applications, only of DOS-applications(!!!), Windows NT
and OS/2 on the other hand, are truly pre-emptive...

> ALL computers require a disk operating system. TOS includes it in ROM,
> the PC loads it from disk. If you're using a disk, you're using a
> disk operating system, true, but on a PC it's not necessarially MS-DOS.
> (You have a choice).

You have a choice using an Atari as well... TOS, MultiTOS, Mag!X, Minix, Unix,
soon to come Linux...

> The Jaguar was brought up because Atari has virtually abandoned the
> Falcon already, putting (according to Bob Brodie, just to satisfy
> Warwick's curiosity) all its resources ($35 million, down from the $50

They haven't abandoned the Falcon, this is plain BS! Just because they're
investing a lot of money in the console market does not mean they give up the
computer-market... The money they make on the jaguar will probably be used to
develope new Falcons...

> ram and are there any hidden catches??

Nope, the Falcon doesn't use SIMMS, unfortunately... You first need to plug in
a SIMM-card (The RAM-Gizmo would be a good coice) costing maybe 100$...I'm not
sure about the price since here in Sweden everything is extremely expensive
anyway...

...your article may have had more creedence had you actually bothered
to look where you were posting it before sending it off. What does
emulating a 68030 have to do with the 6502 ?

FM> Well, is it? We all know the Falcon has a '030 attached via a 16-bit
FM> bus to the memory. Unless we use a 3rd party board, we can't use
FM> FastRAM to get 32-bit access via the CPU.

The speed of the Falcon 16-bit bus is immaterial to the 6502 owner.
You ask if maybe it is just you. Well, is it? In COMP.SYS.ATARI.8BIT ?

FM> You're full of it if you think that we're all supposed to believe it
FM> is going to perform as well as a Falcon.

Well, if you can all believe that 16-bit and 32-bit machines are
actually, in reality, 8-bit machines, then anything is possible!

FM> My point, Darek, if you would pay attention, which apparently
FM> is not your strong suit as you think you know it all...

Darek is not the only poster around here who could use a course in how
to pay attention, but apparently it is not a strong suit.... A little
attention paid to NewsGroup headers would greatly be appreciated by one and
all, as well !

FM> I am not suggesting in any way, shape, or form that you need to make
FM> a 68030 emulator. What I am saying is that if a user wants raw speed,
FM> they would need a high-end PC (486/50 or better) to equal a lowly Mega
FM> STe or slightly better.

Why would I want to emulate a Jackintosh? As a 6502 user I have no
need for a GUI.

[> without Zmodem and a nicer script/macro interface. So, on to my REAL
[> question:
[>
[> "What's _your_ favourite, PD/Shareware/Other, and why?"

CoNnect! :)

In your article you mention that you need internal Zmodem. CoNnect
does this, and it seems to do it faster than XYZ. Also, it will do
it in the background on a regular system. You can use your accessories
while the transfer is going (or even other features of CoNnect, I
suppose). It also has Xmodem, Ymodem, Xmodem 1K, Compuserve B, and
Compuserve B+ built in.

You also mention that you need it to be fast. If you set the right
options with CoNnect, you will have no trouble keeping up with a 14.4K
modem (but the display will be a little jerky).

By "macros", do you mean function keys or scripts? CoNnect does both.
You can define up to eighty (or is it sixty?) function keys. You can
even set the function keys to run other programs, run script files,
execute script commands, or just send a string of text. If you run
a TOS/TTP program, CoNnect will put the prorgam in a window (which
makes everything look seamless).

If you mean scripts, CoNnect has an extremely powerful script
language. You can create the scripts yourself (there are a huge
number of script commands available, including looping and if-then
constructs). If you do not want to write the script yourself, you
can tell CoNnect to do it. You decide what actions it will learn
(uploading, downloading, keyboard, and hanging up). When you connect
to a system, you can have CoNnect execute a script. You can also
(though I have not done this) tell CoNnect to execute a script when

you disconnect.

Do you need emulation? If so, CoNnect has that too. It does the best ANSI emulation available on the ST. It even does blinking text! If you connect to a system that does not do perfect emulation, you can configure CoNnect to make the same mistakes. It also emulates VT-100, VT-200, and VT-220.

CoNnect also has a host of other features. It lets you change the keyboard shortcuts, and change how the dialog boxes look. It has a HyperText-style context-sensitve online help system (which is great). The telephone dialer works a lot like GEM. You can drag telephone entries to the clipboard to clip them, or the trash can to delete them, or the telephone to dial them. Holding down the shift key lets you mark groups of numbers (which you can then dial, clip, or delete). You can sort the numbers by just dragging them to the place where you want them to be. You can decide what action CoNnect will take when it receives different strings from the modem, or how long CoNnect should wait between redials.

There are just millions of features in this program...:)

It is available from atari.archive.umich.edu in the atari/Telecomm directory. The latest version is 2.20.

One of the best things, that I almost forgot to mention, is that the program is still being supported. (It is also in english now, if you do not read german).

So an ICD ADSpeed accellerator gives you a 2X improvement in speed, when tthe manufacturer only claims 50% improvement...?

Are you running specialized benchmarks that ONLY run in RAMcache, or are you really running the nuclear powered plutonium "limited edition" ADSpeed...?

There is NO WAY that a 16Mhz CPU on an 8MHZ bus can consistantly achieve a full 100% improvement in overall speed.

The CPU runs at 16Mhz.. OK, fine...

The *REST* of the ST still runs at 8MHZ...

Unless you can do without such "little things" as Disk Access, and Video access, then 100% improvement is NOT possible.

As a sidenote, Kandinsky 1.54 was not there yet, but I have seen these
.idx files and they are very handy. Can this sort of thing be included
from now on with most programs authors publish on the Internet? Then
there could be some software index like there is for Linux. There they
have an index where one can find which the newest versions are, what
software is available and so on.

TITLE: Re: Atari vs the EXPENSIVE world of DOS

> And on the topic of multitasking systems, and word on
> Linux-68k for the Falcon? (and puhleeeze dont give me any
> stuff about 'the falcon aint powerful enough')

Linux 68K is coming along nicely. The main efforts were originally going into Amiga Linux, but with a keen interest from Mac, and ST/TT owners the kernel is being split to try and keep all the machine specific code separate. There are a few TT people on the case, writing drivers etc.

As for the Falcon, don't worry, The minimum spec, is a 68030 for full memory protection, and I'm sure drivers will be written for the extra screen modes, when XFree becomes available.

>(DUH! I wonder why ;)) and also MultiTOS where it will then support
>Multitasking.

Well I have only read about it, not actually used the program, but it is
a complete multitasking system. It is a replacement AES that will allow
cooperative multitasking and other things. Neodesk can be used as a
desktop, because the Atari desktop will not work correctly with Geneva.
But you could also use other desktops, like Teradesk.

What probably confused you is that you can run Mint, (not MultiTOS)
concurrently with Geneva. If you have Mint you also have preemptive
multitasking. And can run tos programs in windows.

I suppose Geneva is the thing to get if you have an ordinary ST, but a
TT or Falcon can use the 68030's memory protection, which Geneva does
not.

Erlend.

3988. Re: Magazine troubles, Help!

Newsgroup: comp.sys.atari.st

From: Iain.Laskey@barclays.co.uk
Message-ID: <CDC65G.L9L@barclays.co.uk>
Source record: 201195

ST User had a problem duplicating this month. They had a batch of disks copied as 9 sector when they were 10 sector hence the inability to read anything from them. I subscribe and received a new disk without asking 3 days later. The magazines were pulled from the shops (apparantly) and appeared a few days later presumably with fixed disks. You can send the disk back for a new copy. Details are in the magazine.

Sorry folks!

Version 1.54 of Kandinsky contains a bug, which makes Kandinsky crash while redrawing windows under certain circumstances.

That's why there's Version 1.55 (kand155d.zip, kand155e.zip) on the ftp-site ftp.e-technik.tu-muenchen.de.

bye, Uli

} investing a lot of money in the console market does not mean they give up the
} computer-market... The money they make on the jaguar will probably be used to
} develope new Falcons...
}

It seems that way to me too. Why make a machine called 'Falcon 030' when you're not going to go one better (ie: 'Falcon 040')? Why not just call it 'Falcon' ?

It also seems to me that they will make the machine if they think it will produce a profit. "Mr" Sinclair quoted 10000 machines. I'm not sure if I believe that, but if so, then that's quite a lot of money. Don't know whether that's enough profit but assuming thay're all Falcon 1/no hd (unlikely!) that's still about 6,000,000 uk pounds. There has to be a reasonable amount of money in making an upgraded machine (it would *have* to have the 32-bit cpu<-->memory bus, since an '040 can't cope with less...). They'd also be able to jump on the 'clock-doubled' bandwagon :-)

Simon.

3991. Re: *.MOD file format ??

Newsgroup: comp.sys.atari.st
Date: 1993-09-14 10:58:57 UTC
From: incp@rz.tu-clausthal.de
Message-ID: <1993Sep14.105857.6807@solaris.rz.tu-clausthal.de>
Source record: 201162

Anders Skar wrote:
> Is there someone who knows the *.MOD file format ??

Here is a file containing a description of the most popular MODfile
format, the Protracker format. And here we go:

-------cut-------cut-------cut-------cut-------cut-------cut-------

Have you ever wondered how a Protracker 1.0C module is built up?

Well, here's the...

Protracker 1.0C Song/Module Format:

Offset Bytes Description
------ ----- -----------
0 20 Songname. Remember to put trailing null bytes at the end...

Information for sample 1-31:

Offset Bytes Description
------ ----- -----------
20 22 Samplename for sample 1. Pad with null bytes.
42 2 Samplelength for sample 1. Stored as number of words.
Multiply by two to get real sample length in bytes.
44 1 Lower four bits are the finetune value, stored as a signed
four bit number. The upper four bits are not used, and
should be set to zero.
Value: Finetune:
0 0
1 +1
2 +2
3 +3
4 +4
5 +5
6 +6
7 +7
8 -8
9 -7
A -6
B -5
C -4
D -3
E -2
F -1

45 1 Volume for sample 1. Range is $00-$40, or 0-64 decimal.
46 2 Repeat point for sample 1. Stored as number of words offset
from start of sample. Multiply by two to get offset in bytes.
48 2 Repeat Length for sample 1. Stored as number of words in
loop. Multiply by two to get replen in bytes.

Information for the next 30 samples starts here. It's just like the info for
sample 1.

Offset Bytes Description
------ ----- -----------
50 30 Sample 2...
80 30 Sample 3...
.
.
.
890 30 Sample 30...
920 30 Sample 31...

Offset Bytes Description
------ ----- -----------
950 1 Songlength. Range is 1-128.
951 1 Well... this little byte here is set to 127, so that old
trackers will search through all patterns when loading.
Noisetracker uses this byte for restart, but we don't.
952 128 Song positions 0-127. Each hold a number from 0-63 that
tells the tracker what pattern to play at that position.
1080 4 The four letters "M.K." - This is something Mahoney & Kaktus
inserted when they increased the number of samples from
15 to 31. If it's not there, the module/song uses 15 samples
or the text has been removed to make the module harder to
rip. Startrekker puts "FLT4" or "FLT8" there instead.

Offset Bytes Description
------ ----- -----------
1084 1024 Data for pattern 00.
.
.
.
xxxx Number of patterns stored is equal to the highest patternnumber
in the song position table (at offset 952-1079).

Each note is stored as 4 bytes, and all four notes at each position in
the pattern are stored after each other.

00 - chan1 chan2 chan3 chan4
01 - chan1 chan2 chan3 chan4
02 - chan1 chan2 chan3 chan4
etc.

Info for each note:

_____byte 1_____ byte2_ _____byte 3_____ byte4_
/ \ / \ / \ / \

```
0000 0000-00000000 0000 0000-00000000

Upper four 12 bits for Lower four Effect command.
bits of sam- note period. bits of sam-
ple number. ple number.

Periodtable for Tuning 0, Normal
C-1 to B-1 : 856,808,762,720,678,640,604,570,538,508,480,453
C-2 to B-2 : 428,404,381,360,339,320,302,285,269,254,240,226
C-3 to B-3 : 214,202,190,180,170,160,151,143,135,127,120,113

To determine what note to show, scan through the table until you find
the same period as the one stored in byte 1-2. Use the index to look
up in a notenames table.

This is the data stored in a normal song. A packed song starts with the
four letters "PACK", but i don't know how the song is packed: You can
get the source code for the cruncher/decruncher from us if you need it.

In a module, all the samples are stored right after the patterndata.
To determine where a sample starts and stops, you use the sampleinfo
structures in the beginning of the file (from offset 20). Take a look
at the mt_init routine in the playroutine, and you'll see just how it
is done.

Lars "ZAP" Hamre/Amiga Freelancers

-------cut-------cut-------cut-------cut-------cut-------cut-------

That's it. Now take your favourite assembler and write the best tracker
routine. 8-)

bye
Chris
```

SCSI is a *bus*, so you don't daisy-chain devices, you just connect them
all together. If a device has two SCSI ports, they are likely to be directly
wired together.

To add a SCSI device to my system, I just replaced the ribbon cable that
connected the drive to the adaptor with a cable that had a `breakout' socket
in the middle; a second cable went from this socket to the new drive.

>and from a UNIX system with this setup ? (OK it's a bit extreme but for gifs
>etc DD disks at 3 to 4 pictures a disk is a bit of a hassle :-))
>...
I have a SCSI 150Mb tape streamer which I bought second-hand. It works really
well, and can do an image backup of my main hard drive very quickly (That
drive can manage 1MB/sec transfer rate, so can keep the tape moving). The
software (TapeBIOS) is free.

For file-oriented backup (much slower, but more flexible for restoring single
files), I use GNU tar (free software). Tapes written using Unix tar or
GNU tar on the Suns here at JET read perfectly well using GNU tar on my STE.

It takes over an hour to do a file-oriented backup using tar, but I can run
it in the background using MiNT, and get on with other things (obviously, you
need to take care with modifying files as they are being backed up).

3994. Falcon & compatible programs argument (again)

Newsgroup: comp.sys.atari.st
Date: 1993-09-14 11:30:01 UTC
From: cspas050@sus.edu.eur.nl
Message-ID: <2749vp$mop@sus.edu.eur.nl>
Source record: 201161

This is 'Nomen Nescio' again. (Due to an error, everyone cspas account has the name Nomen Nescio).

The problems i had with compatibility were:
1. Games (indeed, i used my atari also for games. Don't shoot me for that ;-)
2. Some P.D. programs,
3. Stos, which definetly has compatibilty problems, NOT only with the Falcon.
4. GFA-basic, that will only work on 'old' st resolution, which is pretty annoying.
5. Outline Art. (NOT a pd program, and not the latest version either, cause i don't have THAT much money).

Anyway, I think it's a weird thing to sell the Falcon as compatible, if 97 percent of the games of the atari st aren't compatible. (Bombuzal IS working)

Then I would like to deny that i don't like the computer. I am a fan of atari for a long time. I own a 8 bit, 16 bit and a 32 bit. I only disagree with their advertisementcampaign (that are obviously utopianlike when saying: full compatible. And they only promote falcons in atari mags. Why not in PC mags. Atariers are allready easy to convinve to buy another atari.)

I see your point...however you have to consider that an updated machine can only be made following certain guidelines. Most Games are hardware specific, and that is because they wish to increase in speed, or have certain calls that are eg. only addressed by a 68000..or whatever...the point is that for games you will find a very low compatibility..same goes when the TT was released, and that serious applications such as Script, Pure C, Lattice, Phoenix-3D, Raystart, Da's Vektor just to mention a few...I mean there are hundreds of program that ARE compatible with the falcon (or any atari for that matter) because they followed the guidelines.

But speaking of which...I think in the U.K. just last year even there was a program released called the gamesmaster? or something weird.....anyway, I saw it run, and it enabled many non-falcon running games to run on the falcon.. might want to check that out..info's anyway?

Yat

Ps: But seriously....how many games on the Atari Platform actually make use of the VDI or AES function calls...? ;) imagine a flight simulator or action game like that....<grin> <smirk>

>Multitasking.

According to what I've read (and a *little* of what I saw at the
MiST show), Geneva IS a re-write of the AES and WILL multitask GEM programs.
However, it will NOT multitask TOS/TTP programs (unless MiNT is also
installed)...

Speaking of AES stuff, if the author of WINX21 (yes, it actually works
on my U.S. MSTE!) is checking out this newsgroup - can you give a short
summary of the features of Winx? (the documentation has a lot of info,
but I'm still a little confused)...

SB>give 2 bombs when run... Any ideas?

Dawnauto needs an installed cookie-jar, but does not install one itself
when there is none, so this might be your problem. Simply make sure that
there is any program *before* dawnauto that installs a cookie-jar. The
position of dawnauto in the auto-folder should not be critical since
dawnauto itself does not hook into any vectors.

RT>RAM that is not specifically made for 3:rd party upgrading ...

I hear that 1Meg machines will be shipped in germany very soon now. Most
dealers will upgrade them to 4MB plus HD, but I am sure that you can get
a 1MB machine if you want to.

RT>All programmers will use 4 Meg, since that's what all Falcons so far has had.
RT>If they released 2 Meg machines nothing (except OS programs ofcoz) would work.

I think there is yet no RAM board which can handle 2MB of memory.

MK>and from a UNIX system with this setup ? (OK it's a bit extreme but for gifs
MK>etc DD disks at 3 to 4 pictures a disk is a bit of a hassle :-))

I use a QIC-150 SCSI tape drive (wangtek 5150ES, a tandberg 3600 worked,
too) on my ADSCSI host adapter, works fine. I use a beta-tape-driver with
a matching tar/cpio, and exchanging tapes with a SUN in both formats is
absolutely no problem.

A good (and available) program to use is GEMAR (get at least V1.23), a GEM-
driven tape backup/restore program which is quite fast. The registered
version can also read/write tar format tapes.

The genesis version can be placed in "violent" mode with a certain set
of keypad movements (like Street Fighter foir the SNES can be put in
enhanced mode). The SNES version cut out the violence all together.
(Well they are still fighting of course . . .)

"The Miracle". A similar package is available
for the Nintendo systems.

Does the ST have any software like this?

There WAS a very good package from a now DEFUNCT company called MIDIMouse Music
out of Oregon. It consisted of four applications: "Note Wizard", "Chord
Magic", "Rythm Time", and "Scale Master." These are basically drills, and are
quite good. Toad Computer of Maryland used to carry it, but it may be hard to
find nowadays. (I found these superior to "Miracle" system - more for adults.)
The disks are heavily copy protected, and a "key disk" is needed to make them
run. Another company that still sells stuff for the ST is ECS (I think that's
the name.) I have a catalogue at home. Send me E-mail or post a note on the
net if your interested. I have one of their applications called "Keyboard
Speed Reading." It's pretty helpful. I understand there are some high-end
programs from Steinberg, and I also have a piece of junk called "Das Ohr."
(Not recommended). Unfortunately, there isn't much support out there for
music education programs for the ST anymore.
Can anyone add to this? I'd be interested myself.

Does something comparable (when I say comparable, I dont necessarily mean in terms of performance ability, I mean in terms of function) to the Macintosh Sample Cell for the ST? I am thinkning about buying a sampler for my set up but was introduced to sample cell recently and wondered if it had an ST counterpart of sorts.
Any help would be highly appreciated.
Thanks in advance.

You think 10,000 falcons sold worldwide in one year is a success? Come on, Apple sell 100,000 a MONTH! I don't think we can say the falcon is yet a success story, if they lower the price maybe it will but at the present rate it is likely to end up like the TT. I want to buy a falcon, but only when it's cheaper that a mac or pc.

Marty, although the GFA BASIC 2.0 interpreter has been placed in the public domain, the compiler remains copyrighted, commercial software. Unfortunately, it would be piracy for someone to send you a copy. If you have the original 2.0 compiler disk, however, just send it to GFA in Salem, Mass and I'm sure they would be happy to dupe it for you. I'm not sure what they charge for it but you can call them at 1-800-766-6GFA.

4020. Re: 1.44Mb drives on Mega STe

Newsgroup: comp.sys.atari.st
Date: 1993-09-14 16:24:07 UTC
From: e89dh@efd.lth.se
Message-ID: <274r77$qee@nic.lth.se>
Source record: 201172

Most ST-owners just have to take the 16MHz signal from the SHIFTER-IC and connect it to the 8MHz in on the (standard) diskdrive controller (or use the HD-detected signal on the 1.44MB DD to shift 8/16MHz). A short program to change the steprate of the drive is also needed. I did it on my megast and it works perfectly (a note, the dd controller is only specified to 10MHz an may not work at 16MHz, however, most do..)

4021. 4 sale: 1040ST etc.

Following hardware and software for sale. Would prefer to sell as a package, but offers accepted on pieces. Please, so there's no confusion later on, let me know if your offer includes an estimate of shipping/insurance, etc.

Or does anyone know of a charitable organization that could use this?

Hardware:
Atari 1040 ST
Color Monitor
Mono Monitor
External DS disk drive
joy sticks
Video Image Digital Interface (VIDI)
Atari ST Realizer (another video interface)
1200 Baud modem
FaST 80 meg hard drive
Panasonic 24-pin printer (nearly new but not compatible with my Mac)
Computer Desk and printer stand

Software:
Wordwriter ST
Publisher ST
Dungeon Master
ChaosStikes Back
Algebra Tutorials
Biology Tutorials
Deadline
Ultima II
Ultima III
Loom
Empire
Silent Service
Shanghai
Bridge 5.0
about 30 STart magazine disks
about 30 PD discs with misc utilities, games, etc.
plus others I can't remember at the moment.

Can deliver and help set up in N. VA/MD/DC area.

call 703-883-7138 days or e-mail.

Magnus Thylander (magnus.thylander@troedp4.ct.se) wrote:

: You have a choice using an Atari as well... TOS, MultiTOS, Mag!X, Minix,
: Unix, soon to come Linux...

This is very misleading. Atari did release a unix System V port. However,
it cost more than a falcon. Why would someone go out and buy a non-standard
piece of hardware like a falcon to run unix? Hell, you can buy Sun 3 and
Sun 4 units for the price of a falcon with a well developed and stable
unix operating system and a decent sized disk. Or you can buy cheap
PC clones and put BSD, Linux, Coherent, Unixware, etc on it...all cheaper
than you can on a falcon.

Also, "soon to come Linux" is simply not true. Linux is not even
remotely close to being available for 68XXX boxes. A very hacked
up version (missing a lot of parts) runs on an *Amiga*, but not
on an ST. I think a stable release of linux for 68XXX boxes is
1-2 years away at best since the kernel was written specifically
to take advantage of the I3/486 architecture. I am frankly amazed
that they have it working even in fits and starts on an Amiga so
soon.

: > The Jaguar was brought up because Atari has virtually abandoned the
: > Falcon already, putting (according to Bob Brodie, just to satisfy
: > Warwick's curiosity) all its resources ($35 million, down from the $50
: > million they said they had to launch the Falcon) toward launching the
: > Jaguar.

: They haven't abandoned the Falcon, this is plain BS! Just because they're
: investing a lot of money in the console market does not mean they give up the
: computer-market... The money they make on the jaguar will probably be used to
: develope new Falcons...

Atari is not competitive in the computer market anymore. If anyone there
is worth their salt they will allocate as much of their resources as
possible towards their products which have a chance in the market, namely
the Jaguar. The ST diehards will not like this, but if they are to stay
in business there are realities that need to be faced.

Regards,

Chris

>
>Does the ST have any software like this?

Well it did. I have some software that does this (Chord Magic, Note Wizard, Scale Master, Rhythm something) from a company called Midimouse Music (I think). But they have since disappeared. This software required a MIDI keyboard. It's not bad software and I suspect there is something else out there like it but I haven't looked to hard.

4028. PD fax programs?

Newsgroup: comp.sys.atari.st
Date: 1993-09-14 19:23:21 UTC
From: selick@csa.bu.edu
Message-ID: <2755n9$nkn@news.bu.edu>
Source record: 201182

I just purchased a Hayes Accura 144+144 fax modem, and I am looking for a PD program to simply send and receive faxes, preferably utilizing some standard file format that Pagestream 2.2 can save/load. I heard something a few months about a GNU program that did this?

Please e-mail me info on any ftp sites, or e-mail me a uuencoded program if you wish.

Thanks a million,
Steve
selick@csa.bu.edu
P.S. I would be interested in info on commercial products if no pd stuff is available, and I'd also like info on pirate alternatives.

Why is this question being asked again? I just answered it a week ago. It
must still be on most systems althought I know some systems with space
problems expire articles pretty fast. I did restrict my answer to the
8bit newsgroup because that is where it was relevent.

AMEN!

P.S. GEMulator 3.0 was the first version that supported the Atari version
of the 6502. It allows you to run SOME of your 8bit software.

>1. Why is atari.binaries not always there?

Partially because I'm slow (I moderate comp.binaries.atari.st) but mostly because I don't get many submissions. There is currently one program waiting in my queue; once I post that, my submission directory will be empty. I can only post what people send me!

>3. I know there's something like ftp, but i don't have
> ftp access. BTW i mailed a ftpmailer but that one didn't respond.

My site has two mail-based servers. The first is archive-server@hyperion.com. It makes an attempt to deal with strange return addresses. It can only get to the comp.sources.atari.st and comp.binaries.atari.st files here. The other mail server is ftpmail@hyperion.com. It's not smart about return addresses (if yours is anything other than user@host.domain you are likely to not get a reply) but it has some features the first one doesn't.

Send either of these servers a message with "help" in the body to get some brief instructions.

I'm not too much into tech stuff regarding monitors, but from my
own experience I don't know why the PTC 1426 should not be a good
monitor. I never had any remarkable problems, and the video
quality is satisfactory to me.
I found out that it is possible to turn up the controls of some
standard VGA monitors far enough to fill the screen entirely, but
I'm not sure if that doesn't harm the monitor in the long run.

>1280x1024 can be achieved on a TT only thogh 3rd Party Graphics Boards eg.
>like the Matrix or NOVA, CRDOT's etc. depending of course if you are looking
>into displaying that rez in color, or monochrome.

As a word of caution, there's some software out there that breaks
down with graphics boards. However, it's always possible to bring
up the system in standard mode if the graphics board is
installed. You may have to plug the monitor from the graphics
card's jack to the standard jack, though, and modify your auto
folder setup to do that.

>The TT High rez in 1280x960x2 requires the TT High Specific Monitor, I think
>it was called the TTM194?

Yes, that's the Atari version, I have one called ProScreen TT, by
Hard & Soft, I think (bought it used).

4037. STbook ?'s

Newsgroup: comp.sys.atari.st
Date: 1993-09-15 01:19:54 UTC
From: dsb@duke.cs.duke.edu
Message-ID: <748055993@amazon.cs.duke.edu>
Source record: 201102

So, what with one thing and another and the realization that 40 columns just isn't enough to work in comfortably, I'm now toying with the idea of buying an ST notebook. The FAQ has little to say on this topic, so perhaps the net can help me with these questions:

- The line in the FAQ about the STbook is not encouraging -- 1 meg RAM and no mention of HD sizes (it _does_ have a hard drive, doesn't it?). Is this up-to-date information? I'd want to run MiNT on it and still be able to do at least rudimentary development work, which probably means 2/40 minimum, preferably more like 4/80.

- What external ports does the Book have? Serial, parallel, DMA, external monitor, cartridge?

- I realize this is probably asking a little much for Atari, but is the Book expandable at all? More memory, bigger hard drive, internal modem maybe?

- I'm _really_ reaching here, but is there a facility whereby the Book's hard drive can be "mounted" on and accessed transparently from a desk system? My main concern with having two separate computers is being able to keep both hard drives pretty much in synch, and the thought of having to do this by floppy-swapping or null-modeming does not appeal to me.

As always, thanks in advance for any information.

Oh come now, can you fairly compare Apples to Oranges (or Ataris!)
in this? Sure Apple may be having a bit of troubles, but which computer
company isnt these days?
Apple has got the resources to advertize, etc, all the good things
that we wish Atari could do.

Some people have posted that the Falcon has been out for a year
now, but thats quite unfair, also. Its only been in recent months that
the Falcons have been getting to real users hands (at least in the USA,
dunno about Europe, or elsewhere)

Take a gander at what Martin did spout on 13 Sep 93 ....

MK> the ST range for hard drive backup. Does anyone have any
MK> experience/warnings/
Well I have just got a Wangtek SCSI QIC 250Mb tape drive working with my STFM (ADSCSI Plus) using Gemar backup software which is just great and was easy to set up/use (just have to careful of the ID set as ICDBOOT doesn't report the streamer as being there when you boot
up).

MK> advice on this. Also - could I use a SCSI tape drive to transfer
MK> files to and from a UNIX system with this setup ? (OK it's a bit
MK> extreme but for gifs etc DD disks at 3 to 4 pictures a disk is a bit
MK> of a hassle :-))
Hmmm, you wouldn't be able to use say Gemar for this I think but will need either a Unix compatible Dump/Restore or tar package (I think there may be a GNU version of this).
The only problem is my streamer is QIC and all of the Unix boxes in work are either DAT or Video8 based so I can't try it out for you.

New this time:

UU1 breaks into the Net Games Top 100!

```
================================================================================
The Net PC Games Top 100 Edition 37 - Week 37 - September 13, 1993
================================================================================
TW LW NW Title Developer/Publisher(s) Cat ID Points
--------------------------------------------------------------------------------
...
100 ( -)^ 1 Unnkulian Underworld {S} Adventions AD [1299] 14
```

Administrative notes:

There has been some confusion about this posting. A few people have objected to my posting it in groups like comp.os.linux(.misc), commenting that "they're DOS games, not appropriate for {Linux, NeXT cubes, Suns}."

I only post this to groups that deal with machines and operating systems *that the games will run on*. Currently, that includes the following:

- PC clones under MS-DOS
- Macintoshes
- Atari ST/TT/Falcon
- Sun Sparcstation (SunOS or Solaris 2)
- Sun 3
- DECstation (MIPS) running Ultrix
- SGI (Iris/Indigo/Indy) running Irix
- Linux (386)
- NeXT

A significant advantage of the all-text format is that the games are easy to port -- trivial, in fact. The machine-independent game files we put on the archive sites will run without modification on any system that has a TADS run-time. Even if your system is not one of those listed above, it should be easy to get the TADS run-time running on it if it is at all Unix-like. Though source to the TADS run-time is not freely distributable, you can generally get it for porting purposes just by asking the folks at High Energy Software and filling out a non-discolsure agreement. (More info about TADS is at the end this message.)

Finally, one person felt that the previous posting was too commerical.
In an effort to avoid abusing the net, I've removed everything but a
brief mention of our commercial game.

Dave
--

The Unnkulian Unventure Series
Adventure Games for the 90's

Remember the good old days, when adventure games challenged you with
great puzzles and evocative descriptions without resorting to any
graphics at all? We really miss that emphasis on gameplay rather than
glitz, so we've decided to write our own adventure games along the
lines of the early text games we liked so much.

If you're looking for top-quality interactive fiction comparable to
1980's commercial offerings, check out the Unnkulian Unventure series,
available from an archive site near you!

In _Unnkulian Underworld: The Unknown Unventure_ you play the part of
Kuulest's slave, and must recover the Orb of Studosity from the evil
Unnkulians. Kuulest, the old geezebag, has died and left you with
nothing to go on but a cryptic message about saving the planet. You'll
encounter amazing Acme products, the infamous Guardian, those witty
creatures known as Drolls, a giant beaver, and even the Dread Unnkulian
Warrior. <Gasp!>

In _Unnkulian Unventure II: The Secret of Acme_ your adventure
continues as you try to create some good press for yourself -- wouldn't
want to fade into anonymous obscurity, now would you? Along the way,
you'll find the answers to these compelling questions, and more:

o What happened to the Unnkulians?
o Why are Acme products so bad?
o What is this cheez stuff, really?

Plus, you'll get to explore Dawg Rock, a Duhdist Retreat, Acme's
clandestine prototypes laboratory, and even pay a visit to Acme HQ.

In _Unnkulia One-Half: The Salesman Triumphant_, you'll play the role
of a down-and-out Acme salesman, forced to work out of the Golden
Dragon Inn, dangerously near Dread Unnkulia. Will you accumulate
enough loot in this frightful backwater berg to turn your fortunes
in your favor?

And, in _Unnkulia Zero: The Search for Amanda_, will you, the Valley
King's most trusted warrior, rescue his Lady Amanda from the gruesome
clutches of the evil Unnkulians?

The Unnkulian Unventures have already gotten rave reviews from numerous
adventure game connoisseurs around the world, so why not give them a try?

The games are available for FTP from the if-archive at ftp.gmd.de.
(Note that the site wuarchive.wustl.edu keeps a mirror of the if-archive

in the mirrors directory.)

PC and compatibles (running DOS):
---

if-archive/games/adventions/pc/unnk1v30.zip
if-archive/games/adventions/pc/unnk2v30.zip
if-archive/games/adventions/pc/unnkhz10.zip

Macintosh:
---

if-archive/games/adventions/mac/unnk1v30.sit.bin
if-archive/games/adventions/mac/unnk2v30.sit.bin
if-archive/games/adventions/mac/unnkhz10.sit.bin

(These are MacBinary files.)

if-archive/games/adventions/mac/unnk1v30.sit.hqx
if-archive/games/adventions/mac/unnk2v30.sit.hqx
if-archive/games/adventions/mac/unnkhz10.sit.hqx

(These are Binhexed Stuffit 1.5.1 files.)

Atari ST/TT/Falcon:
---

if-archive/games/adventions/pc/uu1v301.arc
if-archive/games/adventions/pc/uu2v30.arc
if-archive/games/adventions/pc/unnkhz10.arc

Others:
---

if-archive/games/adventions/others/uu1v301.tar.Z
if-archive/games/adventions/others/uu2v30.tar.Z
if-archive/games/adventions/others/unnkhz10.tar.Z

TADS now runs on lots of different systems. Because of this, the files listed above are TADS .GAM-file only archives that can be used with any machine that runs TADS. The tricky bit is that before you can play the games, you need to get the TADS run-time for your machine.

Fortunately, this isn't hard to do. Just grab the TADS executable package for your machine from the if-archive:

Sun Sparcstation (SunOS):

if-archive/programming/tads/sparc-sunos.tads2exe.tar.Z

Sun Sparcstation (Solaris):

if-archive/programming/tads/sparc-solaris.tads2exe.tar.Z

Sun 3:

if-archive/programming/tads/sun3.tads2exe.tar.Z

DECstation (MIPS) running Ultrix:

if-archive/programming/tads/decmips.tads2exe.tar.Z

SGI (Iris/Indigo/Indy) running Irix:

if-archive/programming/tads/sgi-irix.tads2exe.tar.Z

Linux (386):

if-archive/programming/tads/linux.tads2exe.tar.Z

NeXT:

if-archive/programming/tads/NeXT.tads2exe.tar.Z

Amiga, other Unix:

In the works!

The file How-To-Run-These-Games in the same directory gives
your more information.

NOTE:

The source to TADS 2 is not distributable. However, if your
machine isn't on the list yet, and you would like to volunteer
to port TADS 2 to it, send email about it to Mike Roberts
<mroberts@hinrg.starconn.com>. Porting to Unix-like systems is
fairly trivial.

Unnkulian Unventures I and II are shareware ($10 registration fee
each); registering gets you spiffy maps and agony-sparing hint sheets.

Unnkulia One-Half is free -- don't pay us for it!

Unnkulia One-Half comes with a playable demo of Unnkulia Zero and info
on how to get the complete version.

Happy adventioning!

Dave Baggett

A Word About TADS

We at ADVENTIONS use a programming language called TADS to write our
games. TADS is a product of High Energy Software, and you can get it
via FTP.

TADS (and TADS goodies) are available for many systems from
ftp.gmd.de. Look in the if-archive/programming/tads directory.

TADS is also shareware, and we strongly encourage you to register it if
you use it, since we feel it is a powerful, innovative, and very
inexpensive development system that deserves to be paid for.

Source record: 201070

Hi All,

Someone sent me a private E-mail about two weeks ago asking some questions about the RAM Gizmo. I didn't respond at the time 'cause I was still trying to figure out HOW to respond in private E-mail on Internet. I finally figured that part out, but now I find that my system has purged the message. If whoever sent that message would kindly resend it, I'll be more than happy to answer any and all questions they may have.

My addresses are as follows:

1:286/712@fidonet.org
51:203/2@Atarinet.ftn
90:301/10@Nest.ftn
100:220/3@Turbonet.ftn

I'd give you my Internet address, but since this is being gated to me through an Internet<>Fidonet gateway, I'm not even sure I HAVE a proper Internet address.

Sincerely,
Chris Richards
'Gizmo'

JF> Falcon 4Mb and 80Mb hard drive $1199.

Actually, unless I missed something, the list for this configuration is $1299, so that is a pretty good deal in and of itself.

JF> Did a couple of quick calculations and it seems to be more cost
JF> effective to get the 1Mb version and then upgrade the RAM and hard
JF> drive. 80Mb is too little for me anyway, and I can fit a 300Mb in
JF> there for the same price as the 4/80. However, does the Falcon use
JF> SIMM ram and are there any hidden catches??

The Falcon does not use SIMMs. However, the RAM Gizmo allows you to put SIMMs into the Falcon (shameless plug :-{)). The only caveat is that you have to give up the internal speaker to do so. There are also a couple of other SIMM boards on the market that list for the same price ($99) but they use 32-bit SIMMs, where the RAM Gizmo uses the more common and less expensive 8-bit SIMMs that you find in most PCs. You can get more info on those from either Best Electronics or Toad Computing. As for upgrading the hard drive, the Falcon uses a 2.5" mechanism. I wasn't aware that you could get the 2.5" mech in a 300meg size. Has this changed?

DO> I'll be releasing version 1.15 soon - for the STe/TT/Falcon...

Hi David,

Hey would you mind doing something on that DeskTracker? Could you put in an option to have it steal a buffer of a specified size if I tell it to do so? See, if I have it running, and then run something else, and then Desktracker loads another song of a different size, it causes nasty things to happen to my system. If I could tell Desktracker to just steal 400k or so and keep it, it would make some of my other software REAL happy. :-{)

For that one feature, I'd even be willing to register the software. :-{)

Also, could you have it play a MOD at random from a '*.mod' file description, instead of me having to load all 20 mods and THEN have it cycle through them?

I've got a serial mouse here that I had hooked up to my MegaE for a while. I finally went back to using my crappy Atari Mouse 'cause I just couldn't stand the jerky response that high speed movement gave me with the serial mouse.

Are you talking about the October issue of ST User here? If so, I can inform you that yesterday I received the October cover disk together with an apology for the duplication error. What's funny though, is that I haven't even received my copy of the actual issue yet! Not bad having received the replacement before the corrupted disk itself arrives!

I've got a Spektrum 1 graphics board and an EIZO 16 inch monitor.
The monitor has two inputs (BNC and 15-SUB-D), and you can switch
between these inputs on the front panel. So I can switch between
standard Atari resolutions and the graphics board in a second.
The monitor stores up to 23 resolutions. I get up to 1280x960
(67Hz, interlaced, black/white) or 1024x768 (75Hz, non-inter)
or 1024x1024 (as previous, but with virtual screen/scrolling),
but also ST Low!

A short suggestion for people using TOSSES < 1.60, put the program
cookiexx.prg in your autofolder. Cookiexx.prg installs an empty
cookiejar with space for xx cookies. The program works great, and I have
it permanently installed in my AUTO folder. It can even install more
than 99 cookies, but the info is in the docs. I think the program can be
obtained from ftp.tu-clausthal.de, if not just post and I'll send it for
placement on ftp.cs.ruu.nl

> the ratio between width and height was wrong). Additionally, the frame
> grabber had problems aligning the two frames. Therefore I've skipped
> every second horizontal line and every fourth vertical pixel. That makes
> a resolution of 384x256.........
>

I'm not particularly interested in the scanner stuff, what I want to know is there a commercially available VME bus extension that can be added to an Atari STE (or any ST for that matter) ????????

I don't care about case-cutting or doing any soldering etc as I am a 2nd year Microelectonics student !!

Please E-mail ANY information on this subject BEFORE THE END OF THIS WEEK - I will not be here after *FRIDAY* (got to go back to University).

Any E-mails will be awnsered from here or from Uni. when I get back and get an account setup (they wouldn't give me one last year - meanies !!!!!)

Thanks in advance,

Andrew.

I don't know about harddisk sizes, but all ST Book models have had 4 megs of ram, because it would have been difficult to upgrade later. The odd exception here is that some developer machines have been produced with only 1 meg of ram. Most st book were sold very quickly to musicians and you will have a hard time finding one now. The reasons there is no longer an ST book is that there were lots of complaints becuase the ST Book did not have backlighting on its display s oit had extra long battery life. In less well lighted situation you had to use some goose neck lamp for your st book.

>- What external ports does the Book have? Serial, parallel, DMA,
> external monitor, cartridge?

As far as I know ST Book has all ST interfaces, but for most ports it has not the real things. It has downsized ports, to save space. Nothing that can't be fixed with the proper cable though.

>- I realize this is probably asking a little much for Atari, but is the

Nope, maybe the 2.5 inch IDE drive can be exchanged. I am pretty sure that it can be.

This I am really unsure about, but I think I remember the thing also had an ACSI port, so connecting an ST drive would be possible.

Erlend.
P.S. ignore the childish sinclair post ...

It IS true, information, but not really up-to-date... Probably next month
Atari will distribute Books with 4 Megs. The different configs will be
1 or 4 Mb / 20/40/80/120 Mb (just remember roughly the numbers... like this
anyway...)
>
>- What external ports does the Book have? Serial, parallel, DMA,
> external monitor, cartridge?

Serial, yes, parralel, I think, DMA, sure, external monitor, NOT as I remember,
cartridge: NO, MIDI yes... Plus External Floppy (there is no internal floppy)
These plugs are not standard, for a problem of place, but adapters are shipped
with it...
>
>- I realize this is probably asking a little much for Atari, but is the
> Book expandable at all? More memory, bigger hard drive, internal
> modem maybe?

I don't think it is designed to be expandable at all... You should buy at
first time the right configuration you want... But maybe Atari shops will
update them... I'll ask...
>
>- I'm _really_ reaching here, but is there a facility whereby the Book's
> hard drive can be "mounted" on and accessed transparently from a desk

> to me.

If your desk hard drive is an external one, you should be able to hook it to the STbook's DMA port... But since the Book's HD is 1)internal 2)IDE, I don't think the contrary is possible. Maybe using the book as a slave that controls his own drive, but it is in fact NULL modeming anyway... Unless you find a way to allow 2 ST to communicate through DMA...
>
>As always, thanks in advance for any information.
>

What I think is really interesting in this computer, is it's total autonomy. They announced 10 hours... Someone who have one (1Meg) and really use it told me it is REALLY ten hours... When he goes away for a while, and takes his book with him, he don't have to charge for two days... (you seldom use a computer more than 5 hours a day when you are on holidays or when you travel for one or another reason). ChargingG for 10 more hours takes 1 hour (+30 mn if you use it at the same time), and if you charge for 20 minutes you got 3 hours free... He says it's really convenient... You can use it in a car as long as you want, too... And non-volatile RAM is really wonderful, too... You just be careful on you desk computer not to switch it off before you've saved your work, when you're used to it... It seems to be a really good tool to own...

If you've the money, and for the price, prefer a ST book comparing to a PC book, then buy it ! But wait a while...Wait for the new configs coming soon.

Source record: 201122

Well....to clarify what I meant, when I said the PTC1426 isn't such a great monitor was in fact it's limitations for he price....it might have changed...but it's max. rez is still only 640x480...maybe it can go higher... but not a lot more, by 800x600 at least it needs to be interlaced. So if you want to upgrade to a gfx board..well then you'll be limited to a lower rez. than the board or screen blaser's like blow up030 for the falcon.

I mean also that for around 249-289 U$D you can already get a 1024x768 NI Monitor...which the PTC1426 cannot do...

as for software that doesn't run on Graphics Boards...nearly all serious applications run on any gfx board with either a driver or a new VDI just for that board.

Most Games won't work...if not all....with 3rd party gfx boards....but that doesn't seem to bother many...as most users with a board don't use their atari to play too many games....and as you said....one can turn off a graphics board, either by using some program like X or SUperboot..or with whatever option you get with your 3rd party gfx board.

|> The problems i had with compatibility were:
|> 1. Games (indeed, i used my atari also for games. Don't shoot me
|> for that ;-)
Games are *always* a problem as they hit the hardware directly and often in undocuemnted ways. A lot of ST games broke on the STe and later on the TT/MSTe so the Falcon isn't alone in this respect. You can use Backwards to get most games running anyway so try that and most problems should go away.
|> 2. Some P.D. programs,
Probably written badly and not according to guidelines.

|> 3. Stos, which definetly has compatibilty problems, NOT only with
|> the Falcon.
STOS is badly written. It broke on every OS revision so far.

|> 4. GFA-basic, that will only work on 'old' st resolution, which is
|> pretty annoying.
GFA too breaks all the rules. Hopefully the newer cersion should be better behaved.

|> 5. Outline Art. (NOT a pd program, and not the latest version either,
|> cause i don't have THAT much money).
Valid. A program in this league ought to work.
|> Anyway, I think it's a weird thing to sell the Falcon as compatible, if 97
|> percent of the games of the atari st aren't compatible. (Bombuzal IS working)
I wasn't aware Atari ever claimed the Falcon was 100% compatible. I saw a quote that said it would run the majority of STe compatible stuff. As I've said elsewhere, only VIP Professional won't work on my Falcon, *all* the other applications work fine. Most games (not that I play many :-)) work fine after fiddling with Backwards.

Actually....there was infact an STBOOK in 90/91...and I've seen people in Austria and Germany use it with config's of 4 Megabytes and 65 HD? But after selling about 5000 Pieces worldwise...atari didn't bother to produce them anymore...however at that time there was demand for such a maschine...however that was 2 years ago.

It had a vector pad...could display ST High max. (or only...not sure) and had all the ports a usual ST would have I think....it def. had midi..I remember that as many musicians bought it for portability....as the STACEY was a little bulky...though it is still in demand by musicians.

The boards are cheap. The memory isn't. There is a major memory shortage right now following a factory burning down in the far east Until everyone else ramps up there production, what memory is around is very expensive. In the UK, 1Mb SIMMS have gone from 16GBP to 50GBP each. 4Mb SIMMS are in the 180GBP price range.

I haven't got a clue what Sample Cell is but if it edits and converts samples then Avalon from Steinberg is what you want. If it samples direct to HD then you have several options - most for the Falcon but there certainly used to be 3 or 4 different direct to HD systems for the ST. Cubase Audio gives you direct to HD sampling along with all the usual Cubase sequencing stuff when used on a Falcon.

4063. Winx woes...

Newsgroup: comp.sys.atari.st
Date: 1993-09-15 09:23:11 UTC
From: sanders@sci.kun.nl
Message-ID: <CDE22n.272@sci.kun.nl>
Source record: 201125

Hello,

Well, Winx 2.1 doesn't seem to work for me. I have a Dutch TOS 1.04; Gemram 1.5 does load it into RAM and Winx even patches it. So far, so good. I can move windows, acces the drop-down menus, but when I click on any icon (even the trashcan) I get two bombs. With MiNT loaded, the same thing. If I remember correctly, I get an address error (pid xxx, GEM). I can, however, select toswin from the menu and work in my tcsh (thank God, I could disable Winx again this way). The problem doesn't occur when only either Gemram or Winx is loaded.

Help, anyone?

Thanks,

Sander STOks

Sorry, you're right. I always seem to forget the financial thinking ;-)

But i think that no money for advertising will destroy the ATARI company
in the end. And the end is nearer then we think. (Sorry, I seem to build
a very pessismitic image of myself)

BTW didn't atari had a little profit last year?

Some wrote to me saying the SAM accessory should be able to play them.
Unfortunately I deleted the e-mail before I found out what SAM actually was.

What is it and where can I find it?

|> - The line in the FAQ about the STbook is not encouraging -- 1 meg
|> RAM and no mention of HD sizes (it _does_ have a hard drive, doesn't
|> it?). Is this up-to-date information?
The only place I know that sells them is Gasteiner in the UK. AFAIK it's a
1/40 machine

|> - What external ports does the Book have? Serial, parallel, DMA,
|> external monitor, cartridge?
I think it has most. I played with one a long while back. All the connectors
are non standard though and it comes with a bunch of adaptors.

|> - I realize this is probably asking a little much for Atari, but is the
|> Book expandable at all? More memory, bigger hard drive, internal
|> modem maybe
It has a bay for a modem but I don't know if it was to be a proprietry one or
you can put any old modem in there.

|> - I'm _really_ reaching here, but is there a facility whereby the Book's
|> hard drive can be "mounted" on and accessed transparently from a desk
|> system?
Unlikely althoughthe built in facility for loading/dumping software were quite
good as was the memory managemnt. Lot's of nice CPX stuff. The machine over
here is something like 1275GBP. For that price you'd be better buying a PC
laptop that can take a card and stuffing in a GEMulator I'd have thought :-)
It was apity it's such an expensive beast as when I tried teh ST Book, I loved
it. Had it been more in the 700GBP price I'd have bought one.

>>2 Meg would be more than enough for all of the stuff you'd need for any
>>given Mortal Kombat level. Even with the blood and guts.

>And the screen RAM? And the program? Not a chance.

No sweat. You severly underestimate the efficiency you can get in
compressing data, especially the kinds of data you have in MK, and
still have real-time decompression.

>Not really. Mortal Kombat is a good example here, because it uses
>real-world scanned images (what a cop-out, eh! artists of the world rebel!)
>which are much more difficult to decompress at high speeds, and which
>contain more colours than you would expect in a hand-drawn image.

So you do some other sort of decompression, that's all. One method
which comes immediately to mind is a delta-type animation compression
scheme, which works very well indeed for the kind of action you've
got in MK. There are also several other real-time decompression
schemes which work quite well with the "scanned" images in MK.
I'd say that getting a typical MK scene into 2M is going to be
a difficult challenge, I would not say that it's impossible, not
at all. BTW - if you think that the images in MK are simply scanned
photographs, with no "tweaking", you're a bit naive. All images have
to be processed, to some extent - and processing them for reasonable
compression rates isn't all that hard, or noticable.

>To get Mortal Combat graphics into 1.5M (ie. leave room for code and screen),
>you'd have to cut corners. With 14M you wouldn't have to, in fact, you could
>do a BETTER than arcade-quality game. Of course, ROM isn't free either.
>... but it's nice to have the choice.

That is true. But there are other choices, and CD-ROM is not necessarily
a bad one. It has its limits - but then, so does ROM.

Hi,

In the FAQ for hardware there is a section about Graphic Cards for the ST
which talks about boards from a company called Matrix Datensystem (Germany)
or Matrix GmbH but there is no address for them in the faq.

Does anyone know how I could contact them ?(preferably by english e-mail -
but a snail mail would do)

Thanks,

Martin

B> ADSpeed...?

Here we go again .. first, I've never said 100% Overall increase .. that's a LIE from you, I said 80%, ok? 100% was for pure math (and even you can hopefully understand that that's correct).

GEMBench v3.1 was the last version I tried I think, reported back 183%. (83% INCREASE)

Satisified? I'm running with the AdSpeed ST/Cache with an STE adapter to fit in my STE.

Now end this thread, or use EMail.

Message-ID: <276vk1$fp@hunter-09.cs.strath.ac.uk>
Source record: 201128

Civilization runs fine apart from the buggy colours,but it is relatively easy to get used to them. I have had no luck with Backward or Magi in solving this one problem.

STOS on the other hand has one major bug.The keyboard input routine is totally screwed up on the Falcon, no matter what patches your use.In my experience it constantly repeats the character `6` and messes about with the key repeat.

BTW is there any more news about FalcOS. According to ST Format, it is being produced, but will not be released by Mandarin Software.
(But that report was in ST Format :)

Brian.

4084. where to sell shareware?

Newsgroup: comp.sys.atari.st
Date: 1993-09-15 13:52:47 UTC
From: jab2@stl.stc.co.uk
Message-ID: <JAB2.93Sep15135247@bhars243.stl.stc.co.uk>
Source record: 201132

Has anyone out there tried releasing shareware? How did you do it?

My other half wrote an asteroids type game, except you also had other players zapping back on a ring of STs linked by midi. Also had computer ships flying around. O.K. so it's nothing like asteroids at all really, but it looked vaguely like it to me (spot the non-computer-game-player)

He sent it off to various U.K. PD libraries round about May and I haven't even seen it in a catalogue yet. So anyone know some better places to send it? If you buy shareware/PD where do you get it from? Is it normal to have a whacking great delay before things get out?

I suppose about now you're saying, "They probably didn't list it 'cause it's rubbish". Admittedly I'm no expert, but everyone who has had a go at the game enjoyed it to the point where we had to pull the cables out to stop them playing, so it can't be that bad.

He's got more strategic stuff co-written with some friends and a folding editor, but has got all discouraged about releasing them since the first program seems to have vanished. Seems a shame that good software is going to waste for lack of a shop window

If anyone has any good ideas on where he might send stuff please email me as I'm off to a meeting for the rest of the week and might miss your answers.

Jennifer

Lots of people will write back to you saying, "COOL, release it on the net and I will *definitely* register." To keep such things in perspective, please do "your other half" a favor and read this; it comes from hard-earned experience.

The main rule of shareware games is this:

If you want to get any registrations at all, you'd better give something to the people who register, and they'd better really want it; otherwise you'll get about 5 registrations total and will feel like a jerk.

Do what Apogee did with the Keen games and Wolf-3D (PC) -- release one game that has a few levels, and then give people the next two games (with more levels) when they "register." Whatever you actually put on BBS's and the Internet will be a complete throw-away in terms of profit; its only financial purpose is as "bait." The better the bait, the more registrations.

In the case of this asteroids game, you might release the game without the MIDI support -- that's something that makes it "really K00L" to all the BIFF's out there who wouldn't normally register. If you force people to pay for the K00L enhancement, they will. If you just ask them to pay for something they already have (just to be nice to you), they won't. (Unless they're one of the .00001% of the community that registers to support the market -- though shareware authors love those people, there aren't very many of them.)

I haven't seen any other distribution methods that have worked well for shareware games. There are other options for utility programs but games are a harder sell because you don't actually *need* them for anything.

The bottom line is that if you're expecting to make "real" money, don't bother, because especially in the small and still shrinking ST market your chances are almost zero of doing so. Only do it for fun; otherwise make a *real* venture out of it and write a commercial game.

>Is it normal to have a whacking great delay before things get out?

I found that it took about 6 months before people in general were aware of anything I'd released, even when I put it on the Internet. It just takes a while. The online services like CIS and GEnie give you an idea of how appealing your game is at first glance because they have a download count. But if you haven't used the method above, it's likely you won't ever hear much. Try changing the distribution scheme, and you might get more response.

>He's got more strategic stuff co-written with some friends and a
>folding editor, but has got all discouraged about releasing them
>since the first program seems to have vanished.

Well he should be. Tell him to either bail to another platform like the PC, where there are 2 million potential shareware buyers, or to start taking the amount of time he's spending seriously and really design a commercial program from start to finish, making sure beforehand that there's really a decent-sized market for it. (For games, this is generally true regardless of game type.)

Better yet, tell him to design a *portable* program, so that he can get it running on a Mac or PC without horrendous amounts of recoding. For C, at least, if you are careful about keeping the low-level stuff separate from the game logic, you can even do this with games. (HacMan II builds from the same source on both the ST and PC, against a library that's machine-dependent.)

>Seems a shame that good software is going to waste for lack of a
>shop window

The software business is full of personal highs and lows, and the market has no sympathy. Take the odds against shareware (and even commercial) success in today's market -- these days it's in many ways easier to write a complicated piece of software than it is to market it and get it on the shelves.

Look at Microsoft, for example. They're a marketing company first and a technology company second. Windows 3.1 still frustrates programmers with the same brain-damaged segement crap and 16-bit code that (non-extended) DOS is notorious for. But it's the most popular "GUI" in the world, and most people think Microsoft invented mice, icons, and windows because of it.

A lot of programmers -- especially the ones who write shareware -- miss the fact that there's a lot more to a successful program than just the coding. And that's even more true today in the ST market than it was 4 years ago.

While the ST Book remains an officially announced product (as far as I know), this has to be tempered by the qualifications that Atari has also officially announced that mass market Books must have both backlit displays and long battery life (difficult), and that any future ST-like computers they release will in fact be Falcon-like (which the Book, as developed, shown and announced wasn't). I seriously doubt that Atari has the resources to make the needed changes ->At he same time as they try to push lots of Jaguars out the door AND try to build a presence with the desktop Falcon<-. MAJOR bummer, but that's sure the way it looks. Maybe a Falcon book, but probably not soon enough to matter to anyone shopping right now.

Source record: 201140

```
------------------------ Original Article ------------------------
>I have an ST and I have a MIDI keyboard.
>Question: Is there any AI software out there
>that will teach me how to play better?
>
Well it did. I have some software that does this (Chord Magic, Note Wizard,
Scale Master, Rhythm something) from a company called Midimouse Music (I think).
But they have since disappeared. This software required a MIDI keyboard. It's
not bad software and I suspect there is something else out there like it but I
haven't looked to hard.

There was indeed an excellent series from the now DEFUNCT MIDIMouse Music as
described above. It can still be found, but it's getting scarce. I suggest
calling around. It's heavily copy protected, and requires a key disk. I
bought it, and can't even get backup copies. I have one key disk left, and
if that ever gets wiped out, I'm out of business. I find the series to be
excellent, and have learned a lot since using it.

I mentioned earlier another company that still supports the ST called ECS -
Electronics Courseware Systems, 1210 Lancaster Drive, Champaign, Illinois,
61821 telephone (217) 359-7099. They offer a lot of drill programs that
can be useful, although be prepared to shell out lots of $$$ if you want the
entire set. It seems to be geared towards music schools and such. Good luck.
I'd be interested in knowing of other software out there. I understand there
is an article in the latest Atari Explorer that talks about available music
education programs. I have GEnie, but I haven't yet figured out how to
download that kind of stuff :-(

4089. SLM804, LaTEX problems (SLM804 newbie)

Newsgroup: comp.sys.atari.st
Date: 1993-09-15 15:43:21 UTC
From: apaul@kilo.engr.mun.ca
Message-ID: <apaul.748107801@femto.engr.mun.ca>
Source record: 201143

I just picked up an SLM804, and am having some trouble getting it to print LaTEX stuff. It prints fine with Calamus.

I previously had a HP DJ, and had no trouble. It seems to think everything
is OK, but it only prints out blank pages. It gives no errors about not finding fonts or anything; it just happily spits out blank pages.

I'm using the CS-Tex Package, and am using the enclosed DVI_SLM driver.

Thinking It might be something to do with an older version of the CS-Tex package, I just installed the newest version from atari.archive. The only thing
I suceeded in doing was making the program run everything twice. That is,
no if I select preview, I get to preview the file, then I hit UNDO to exit, and the previewer runs again showing me the file again. This isn't
too bad, but when you try and print a 10 page file, and it decides to print
it twice, that IS annoying.

One other thing, half the time I can't acces my hard drives unless I have the printer turned on (VERY annoying). What's the normal way of dealing with this?

Help with these problems (particularly the printer related one) would be greatly appreciated.

Thanks

Sometimes i have to start right into a shell (ksh) because
i need the extra memory to print some PS files using
GhostScript.

I have the feeling GS is much slower and i'm wondering
if the ST runs with 8 Mhz w/o cage instead of 16 Mhz w cage.

Is there a way to set the CPU Speed without GEM?

Thanks in advance

I wish I knew. I have never been a fan of the Street Fighters,
Streets of Rage, Mortal Kombat, Kick 'em Butts, etc etc games. It
amazes me that those games are getting so big. Heck, isn't there
a Street Fighter movie in the making or something by now?

Then again, it's my opinion. *I* just don't find any interest in
those games, so I don't play them, or once in a blue moon, no more.

Steph.

People who like the duel games don't necessarily like Streets of
Rage type games... personally I think that game sucks, same with the
Turtle and Final Fight whatever... too lame. But the one-on-one fighting
games have a depth technique of which many people are not aware. I did not
like them at all until I experienced Street Fighter II back in 1990.

>It retails for about US$300 and is called
>"The Miracle". A similar package is available
>for the Nintendo systems.

>Does the ST have any software like this?

Although this isn't a very good answer to your question I'll post it anyway
for anyone who is interested.

The Miracle is also available for Mac and Amiga.

As I said, not realy an answer, but it may help some people.

Chances are there is an Atari version

I have a Miracle hooked up to my PC, and it is doing quite a good job of
teaching me to play the piano, it's only drawback is that it only has 8 midi
channels.

Hope this helps someone,

Chris.

4099. 520STFM->1040 dip ram upgrade needs resistors???

Newsgroup: comp.sys.atari.st
Date: 1993-09-16 01:27:17 UTC
From: ocia@tekig5.pen.tek.com
Message-ID: <11506@tekig7.PEN.TEK.COM>
Source record: 201066
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I was told by one source that if I found empty pads (to drop 256k x 1 dip ram into) in a 520STFM that I would also need to add some series resistors to make the ram upgrade work. Another person disagreed.

Has someone actually personally really done such an upgrade themselves and can state whether there are some resistors involved or not? I am assuming that these might be series resistors to reduce overshoot but I don't know.

While I am here, anyone have an old upgrade for a 520 they would part with?
How about a double sided floppy drive mechanism?
How about a scsi interface card? (had a deal settled but then no answer to mail)

4100. SCSI Controller Cards

Newsgroup: comp.sys.atari.st
Date: 1993-09-16 01:42:50 UTC
From: vsnyder@math.jpl.nasa.gov
Message-ID: <278gaq$a7d@netline-fddi.jpl.nasa.gov>
Source record: 201067

Long ago, I constructed a disk subsystem for my ST by using an ACSI->SCSI adapter, and an Adaptec ACB-4000 to adapt SCSI to MFM. Now I need to adapt SCSI->ESDI. Adaptec claims not to make such interfaces any longer.

1. Does anybody know the part numbers for Adaptec SCSI->ESDI adapters, especially those that handle 4 or 8 LUNs?

2. Does anybody know where to get such adapters?

3. Does amybody know other kinds of SCSI->ESDI adapters?

E-mail please.

Thanks in advance

You'll need a IDE interface. There are several, most (all?) have an integrated TOS 2.06 extension card (which you'll need to be able to autoboot). Hard&Soft's card can be installed into a 1040 with enough room left for a 2.5" IDE drive.

Sure sounds to me like you said that puttin a 16Mhz Adspeed/Cache in your old STE gave you almost 180-190% improvement in real world applications, with packers and such stuff gaining 200%...

Now if you didn't mean 190% "improvement", why did you say it in the first place..?

Now that we know who said what, I agree, we can end this thread.

4109. Atari vs the EXPENSIVE world of DOS

Newsgroup: comp.sys.atari.st
Date: 1993-09-16 06:52:00 UTC
From: Curt.Fluegel@f47.n282.z1.tdkt.kksys.com
Message-ID: <748207879.AA08949@tdkt.kksys.com>
Source record: 201031

as for having enough money to produce the Falcon 030, its hardly the point since it has already been created on paper. Its more the fact that at least in the US the serial #s are still around #1000. If they release an 040 they'll have to knock the 030 prices down to make room (I doubt Atari could sell a $2000 computer). And with all there free cash tied up in Jaguar stuff (the big advertising rollout) it sounds like the Falcon wont due much until '94.. (don't get me wrong, I love mine!) yes your ST can teach you to play piano. I believe the software is called Pianistics. Off hand I dont remeber who makes it. If you would like to , call me at work 612-631-9424 (I work for a music store and we sell software for Atari) just ask for Curt in Software.

Do you mean Timeworks DTP v1 or v2? I can't get v1 to work so please let me
know if you can!

Indeed! I must say most of the news nowadays concern the Falcon, not the ST, I
don't understand how people can claim "Low software-support"...The software
there is is GREAT, and it will become even better when
programmers start squeezing the Falcon a bit!

In all anonymous FTP sites, there is generally a directory that can be accessed in write mode just for this purpose. You make an archive of your package, you FTP/put it on the "incoming" (or anything like this) folder of the site of your choice, and you generally send a mail to the FTP administrator... Read the README files in the sites for more appropriate information.

Hi!

For all those folks, who got the latest Beta-Version of DESKCOPY
(MiNT-filenames, ONLINE-registering):

Please don't give the BETA away, DON'T put it on any FTP-Server!

FTP-admins: Please check out, if there is an DESKCOPY-Upload on you FTP-Server,
if the date of the version is >=1.9.93 or if there is a "BETA" in the
DESKCOPY-Infobox - this version should be killed!

When DESKCOPY is ready to be no beta anymore, I will give it free again.

Thanx & Greets, Roland.

Source record: 201085

Hey atariers,

Here i am (again & again), i would like to adjust my opinion
about compatablity of the falcon. After my (angry) letter to this
nngroup, i got a lotta response, someone send me Backwards (Thanks Uwe !)

And now all the games i tested yet (i one day seemed to work)

In fact the only program that still didn't work was outline art. So i
will have to buy that update once. (Or i just keep using it on my 1040stfm)

But all other things seemed to work just fine!

So, to all atari-st(e)-ers Now there is NO reason not to update to a falcon.
(Except financial perhaps ;-))

4118. where to sell shareware?

Newsgroup: comp.sys.atari.st
Date: 1993-09-16 09:13:00 UTC
From: richard.hecker@canrem.com
Message-ID: <60.36970.4514.0N183CC3@canrem.com>
Source record: 201094

I wrote a Shareware utility some time ago -- it was a character editor and survival kit for the game Ishar: Legend of the Fortress by Silmarils. I wrote it in January of '93 and released it locally (to the Toronto, Ontario area) but didn't getmuch of a response, even though I know a few people had downloaded it. When it was sent up to an Internet site, however, I did recieve some response from someone in California just the other day -- the first bit of response I got, actually, and thus far, the only -- though it was only sent to the Internet a month or two ago. Admittedly there isn't a large response from shareware that is released, but if the program is good enough it will get some amount of response.
Utilities seem to get the most response if only because the people who collect good utilities are more likely to send donations or registration fees. Game players seem to be somewhat less likely to do so ... a strange truism.

So Internet is probably one of the good places to send good shareware. PD libraries appear to be few and far between around the world, and usually receive a little less response. Large multiline boards, particularily ones that net internationally, get a fairly decent response.

Source record: 201086

Is there anyone else out there who has a TT and has problems with the sound.cpx in the distribution (besides the fact that when unarchived, the path names for the files that should be in the cpx/ directory are miss-named to "cpx-sound.cpx" instead of "cpx/sound.cpx" and put in the root directory)? Whenever I run the sound.cpx that comes with the distribution, I always get the message "computer doesn't have stereo sound" or something like that, when I try to access it in the control panel. It doesn't seem to matter whether it is TT/ST ram, or if any other software is loaded (did same thing with _nothing_ in the autofolder).

Thanks,

MikeB

4120. Marc archiver desktop for MultiTOS

Newsgroup: comp.sys.atari.st
Date: 1993-09-16 09:26:01 UTC
From: mppi76@cd4680fs.rrze.uni-erlangen.de
Message-ID: <279bfaE3ik@uni-erlangen.de>
Source record: 200796

Product information about a brand new programm...

MARC 4.0 - the Multitasking Archiver Desktop

MARC is an application that only runs with ATARI MultiTOS and AES 4.x which allows to handle files in archives just like normal unpacked files.

MultiTOS and MINT make it possible for MARC to start standard archivers like LZH, ZOO, ARC and ZIP in the background, while MARC itself builds the GEM interface.

MARC creates a window with a small desktop and 2 file windows. In these windows all files are shown like in the desktop's windows (even with the installed icons). All archives appear as folders. Double click on the archive-folder and it will be opened!
In the background the archiver is working and sends all information about the archive to MARC which will show the directory in the window then.

To unpack a file just drag it into the other window: It will be "copied" - in this case it will be unpacked, too. To read a packed README-file just drag it to MARC's window-icon and it will be shown in a textwindow or any other editor you want. It's also possible to print files (via GDOS or another program), to delete files and certainly to create new archives graphically. Needless to say that all this can be done with normal files, too.

All these functions are working in the background, too. So you don't have to wait until it is done to give the next command (via mouse or keyboard). All jobs are stored in a queue where they wait to be executed - even if MARC has already "ended".

Everyone working often with archives (like you when getting software via ftp) will find it very useful to know all details about archives without decompressing the whole thing. Just double click the compressed README file. And you can already work with a newly decompressed "archive" while MARC decompresses the next...

The archivers

MARC works with many different archivers. Configuration files (PIN-files) for LZH, ARC, ZOO and ZIP are included. Others can be used writing other configuration files, too.

Where to get MARC from?

A demo version is available for DM 20 ($15). If you purchase the full version later you will get it at DM 15 ($10) off the normal price then.

MARC is available for DM 79 ($ 55) including a detailed manual. Students
and educational establishments may get it at an reduction of 20%.

4123. a Tale of Fish and Ant

Newsgroup: comp.sys.atari.st
Date: 1993-09-16 10:44:45 UTC
From: error@blade.stack.urc.tue.nl
Message-ID: <279g2t$q87@tuegate.tue.nl>
Source record: 201089

Fish? Ant?
Let me explain. I have a good idea. About Fish and Ant.
Fish stands for File Indexing Systhem (the h must go somewhere ;-)
Ant stands for Atari Network Treasury.
What are these concepts about?
Fish can index every shareware/pd/freeware program in existance, so people know what is around. Fish will be a document, perhaps with a viewer program, but basically a document. What needs to be done to get such a thing going? We need one or two persons that want to maintain this index. Just think about it. If you maintain the index, you will know about all software! (sortof)
But what also needs to be done is to create some discussion first about what should be in the index. I can think of things like: filename, author, status (free/pd/share) system requirements, incompatibilities, description etc. Then we will need a form that authors or others can fill in and send to the maintainers of the index. After that everybody can request the index from the maintainers and search the index for suitable software.
That woulb be GREAT wouldn't it? If you have a little time to spare, start this project!
Now about the Ant. Ant will be an electronic book. The book is sort of an FAQ but much much bigger. In it will be every piece of available information on the Atari 68xxx based computers, from programming to hardware info. What is needed again are one/two or even more people that integrate the information available. They will receive up to dat information and distribute the book on request. There should be some discussion first on what should be in the book of course.
I can think of Gdos info (information on GDOS is now available in about 15 different files, with a lot of duplication and disagreement.), file format info, gem programming info, how does XBRA work, how do I expand the memory etc. etc. The good thing is that most of the info is already available, but is very fragmented. We need some integration. At last there can be an alternative to the Profibuch. The maintainers of course needn't write the info, just integrate it.
Just two good ideas that really should be implemented, but are there people out there that would like to do these tings?

Erlend.

>Can anyone tell me how to get an English version of Connect? I D/L'd it and
>it is in German, is there even an English version?

If you downloaded Connect 2.20, then it is also the english version.
You simply need to rename a couple files (hope I get these names right):

-rename CONNECT.RSC to CONNGER.RSC
-rename CONNECT.HLP to CONNGER.HLP
-rename CONNENG.RSC to CONNECT.RSC
-rename CONNENG.HLP to CONNECT.HLP

After making these renamings, when you load up it should be in
english (this should also apply to some earlier versions of CoNnect as well)...

To get falcon-like performance, install Windoze on a '386/33; the Falcon
is a SLOW machine no matter how you look at it (unless you've been using
an ST all your life, and nothing else).

> >Windows does true pre-emptive multitasking... that dealer should read
> >a few magazine articles.
>
> My dealer _also_ sells MS-DOS machines, and invests the time to
> stay knowledgable on the technical details of both systems.

If Windows did pre-emptive multitasking, single applications wouldn't be
able to hog the system so easily. Also, when you install Windows, it
doesn't multitask DOS programs _at_all_, you have to change the default
settings to get that to work.

> True, there is a standard operating system that ships with *every*
> Atari. It's also true that you can get alternate operating systems
> (OS-9 springs to mind) that will run on the Atari. I see discussions
> of alternate file systems on other threads in this and other Atari
> groups, so I can assume there are a few more....

The alternate filesystem thread has almost nothing to do with operating
systems; it's about MiNT (which isn't a complete OS, since it relies on
the underlying TOS to get its work done).

> >Atari has been "rebuilding" its dealer network for the past seven years.
>
> Persistant, aren't they?

More like 'stupid', IMHO. The number of dealers just keeps shrinking.
You really can't call music shops 'dealers', since probably 99% of them
have no clue about computers, they just know that the Atari machines
have MIDI ports already, and a few good software packages.

> Based on this, Atari is:
> A) Actively marketing to the end user,

Hahahahahaha....

> B) Actively supporting their existing dealers, and

Hahahahahaha... That one's even better; have you forgotten what's
happened to Canadian dealers ever since Atari Canada was 'right-sized'
out of existance?

> C) Being actively supported by their existing dealers.

Atari's _needs_ to be held up by its dealers or it would've died
completely in the past four years.

> With this kind of support, there will be more dealers in the future.

But still no hardware for them to sell, and no one to sell it to because
the Falcon is not competitive with _anything_ else on the market.

> >The Jaguar was brought up because Atari has virtually abandoned the Falcon
> >already, putting (according to Bob Brodie, just to satisfy Warwick's

>
> It that were true, they wouldn't have been at the San Diego Computer
> Fair, actively demonstrating only the Falcon!

Yes it would, because they _can't_ demo the Jaguar yet, so the Falcon is
their only potential source of income right now. They certainly haven't
been demoing a more powerful Falcon anywhere, now have they?

The IBM name and superior marketing is what made the PC and Clones so predominent in the marketplace. You know that compared to the ST or Falcon, the PC just doesn't cut it hardware wise. Same goes for the Amiga. Hardware wise, it beats the clones too. It's had pre-emptive multi-tasking since it was introduced in '85 or so. One of the best kept secrets in computers.

Neither Atari nor Commodore will ever win any marketing awards.

The new version of BeforeDawn works very well on my system; if I load the SilkMouse mouse accelarator, it still locks up. I'll have to send a copy of this accelarator to the author to see if he can track down the problem.

I've also found that I can load more than one ACC (as long as I don't try to use XControl) under MiNT if I load The Chameleon as well. If I try to open Chameleon, GEM suffers an Address Error and dies, but the other ACCs work normally. This is _very_ weird.

One would think that if the Jaguar makes money that Atari will reinvest
most of the money in the Jaguar. (It'll maximize their return).

FYI, _all_ PS/2 mice are bus mice; that's the machine that originated
that style of mouse... that's why they're also called "PS/2-style"!

4M is NOT enough for C++ programming; 8M would be ideal, and so much
cheaper than 16M (of which 2M is wasted).

I'm using 2.0x. It is however a beta copy. GST have updated the program to be falcon compatible after some discussion on CIX as to what wasn't working. The version I have seems to work fine although I cannot yet print. :-(They are looking at this currently. The Falcon version will AFAIK have no extra functions apart from working and supporting Speedo.

>installed)...
>

You can also use PowerDOS with Geneva. PowerDOS isn't in full release
yet, but it's authors (And the authors of Geneva) are working
to make tem work together seamlessly...

For those that don't know, PowerDOS is a preemptive multitasking
kernal, significantly better than MiNT. It only has a 1% overhead,
it multi-tasks during disk access without problem, supports shared
memory, networking between multiple systems, and so on...

Someone I know, who's been beta-testing PowerDOS, routinely runs
POV in the backgroun, without a noticeable slowdown to the system.
With PowerDOS being much quick than MiNT, and Geneva being FAR
quicker than MultiTOS (PowerDOS is 100% assembler, only uses
about 67K of RAM), using PowerDOS/Geneva will give you a _MUCH_
quick multitasking solution than MultiTOS, with far less memory
needed. Geneva only uses about 160K or so, I think, so you get
complete preemptive multitasking, wih almost no performance loss, for
under 250K. :) Useable even on a 1040!

Hope you found that interesting... Be watching for it!

(PowerDOS is shareware, Geneva is commercail, for those of
you just tuning in. :))

The TT has a 32-bit bus at 16Mhz. (Annoying, but not crippled like the
Falcon design.)

> one hell of a job in designing the bus system to keep up with the 68030 cache.

4137. loosing characters trying tor read from midi port

Newsgroup: comp.sys.atari.st
Date: 1993-09-16 13:37:21 UTC
From: jacob@max.cc.brandeis.edu
Message-ID: <1993Sep16.133721.4829@news.cs.brandeis.edu>
Source record: 201100
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

i have this function read_note() that
1. throws awa anything it read s from midi port
until it hits an note ON message
2. reads note number and velocity
3. sends that note on message to midi port (to hear
the note)
4. throws anything it reads from midi port until
it hits note OFF message corresponding to note and
channel from (1).
5. playes that note off

my problem is that it sometimes rather erraticall loses
the note off in step (4). i'm prett sure my keyboard
does send it always because my sequencer (probably
a better progtram than min :-) never loses note off.

this seems to happen especially often when i play on
and off very quickly (that is release key bery quickly)
so i don't think it's a question of buffer size

anyonw has any idea what's going on?

thanks
jacob

------------------------ Original Article ------------------------
>"The Miracle". A similar package is available
>for the Nintendo systems.

>Does the ST have any software like this?

The Miracle is also available for Mac and Amiga.

Chances are there is an Atari version

There is NOT an Atari version of "Miracle Music System." I called the company
a while back, and they do not have any plans to make one, either. They also
told me that the "Miracle" system does not use MIDI, but uses another way to
allow the keyboard to talk to the computer. I'm not a technical nerd, so I'm
not sure about what they are talking about. Maybe someone else can expand on
this. In a demo of the system, I found it to be too much like a video game, and
too elementary to be of much use.

4141. Aggressive Party - one month left!

Newsgroup: comp.sys.atari.st
Date: 1993-09-16 17:01:14 UTC
From: kkallio@vipunen.hut.fi
Message-ID: <kkallio.748198874@vipunen.hut.fi>
Source record: 201002

```
Aggressive Party
----------------

Aggressive Party is an Atari (ST/TT/Falcon030) Party, but there are
also some Amiga- and PC-competitions. It is organized by Aggression
and Future Crew.
Falcon030 will be strongly visible at the party - Thanks to ION Finland.
They will also have some new exciting Atari hardware to demonstrate.

Note for Finns only: Suomalaisille on Falconista oma Party-tarjous.
Tarjous on hyvin edullinen, ja maksu voidaan hoitaa vaikkapa osamak-
sulla. Alle 18 vuotiaille tarvitaan vanhempien takaus. Tarjous on
voimassa vain ja ainoastaan partyilla. Soitelkaa meille juuri ennen
partyja ja kysykaa lisaa.

Where and When?
---------------

The Party will be held in Europes biggest indoor amusement park called
Planet FunFun. It is located in Kerava, Finland, approximately 30 km
north of Helsinki. It starts on Friday, 8th of October at 16:00 and ends
on Sunday, 10th of October at 18:00. We can let foreign visitors to
enter as early as 12:00 on Friday, because usually ships from Sweden and
Germany arrive in Helsinki in the morning.

Planet FunFun is an excellent place for demo-parties. We have rented a
big hall for you and your computers and a smaller separate hall for
sleeping. There are also showers next to the smaller hall. And lots of
free parking space.

We have also an "amphitheather", in which we can show competitions and
movies on big screen. There is a couple of hundred seats, so this time
you don't have to stand to see anything.

The best thing though is: The whole amusement park is at your use. The
gadgets in it are in use only 10:00-18:00 Saturdays and Sundays, when it
is open for normal audience also, but we have some special arrangements
with it's restaurants. (Which serve also alcohol...) There will be food
and soft drinks available 24h, and you can also buy proper meals at
19:00-21:00 from a restaurant called Harlin's Diner. Alcohol will also
be served at Harlin's diner at 21:00-24:00, but only for those who have
had their 18th birthday...

Also the arcade-games in it are at use 24h, as well as "Nintendo Land".

Restaurants are of course open also when the amusement park is open for
normal audience.
```

How to get there

It is very easy to get to Kerava. If you come by ferry to Helsinki and have a car with you, just follow the sings "Lahti" which leads you to the Lahti-highway (E75 or 4). Then turn off the highway at Kerava, and follow the signs "Planet FunFun". We will also put some Aggressive Party signs there.

If you come by ferry and don't have a car with you, you can come by train. Take train with label "K" and get off at Savio-station (the one before Kerava). You will stand right in front of Planet FunFun. We will arrange a free transport service from Helsinki to Kerava for computers, so you don't have to carry your monitor with teeth when you walk to the station. You can call our info-phone from the ship and ask when the next car will arrive.

For those who come by plane it is also easy to get to the Kerava, since there is bus from airport to Kerava. To make your travelling even more easier we can come and fetch you from the airport if you just inform us beforehand. It will cost you only 10 FIM.

Entrance fee

Entrance fee is 100 FIM.
Lockers are available for you without any extra cost.

Info-line

We will have a 24-h info line during the party. Its number is

+358-(9)0-294 4023

As you can see, it is Xenits home number. We will just transfer the calls coming to it to Planet FunFun. If you call it from Finland drop 358 and if from Finland near Helsinki drop 90.

Competitions

There are competitions for Atari, PC and Amiga, and a music (module) competition for all computers, since protracker mod-format is so widely used accross the platforms.

In all competitions we will have an initial jury consisting of us and our sponsors, which selects the best 20 productions in every competition. Then the final jury consists of the authors of these productions.

DEADLINE for all competitions is at 14:00 on Saturday, 9th October, 1993.

There may be some minor changes in prizes, if we will get some new sponsors. The promised value of the prize will not change, there may just be a bit more hardware.

Atari competitions

As our main interest is in Atari, the most of the competitions are for it.

Atari demo

Rules: Demo must work on an STe with 2 Mb of memory.

Autobooting is a must.

Demos must be previously unreleased. Released previews
do not bother us.

One group may attend with several demos.

We don't suggest you to attend with an unfinished demo, but:
The demo must be either released OR you have time to finish
it and you will get the possible prize after you have sent
us a finished version.

Prizes: 1. Falcon030 computer.
2. External disk drive + 2500 FIM
3. External disk drive + 500 FIM

Atari demo competition is sponsored by Oy ION Finland, the official
Atari-importer in Finland and Man&Man Co.

Atari intro

Rules: The computer is Atari STe with 1 Mb.
The maximum lenght of the file is 40960 bytes.
The program MUST be an executable file, no autobooting allowed.

Prizes: 1. External disk-drive + 500 FIM
2. 500 FIM
3. 200 FIM

Atari intro competition is sponsored by Man&Man Co.

Atari graphics

Rules: We will not accept copied pictures. A person who tries to
attend with a copied picture will be disqualified from this
and any other competition arranged by us or our allies.
Nobody plays with Aggression.

If a copied picture gets thru our inquisition and wins
something, the author of it is obliged to return the prize
to us when we will notice the cheat.

Pictures must be previously unreleased material.
Everyone should leave min. 3 different stages of his work to
the jury, so they can make sure the picture is not a copy.

Only the last one will take part in to the competition.
Picture must be IFF, PI1 or executable.
Pictures will be shown on an STe.
We will make a slideshow of all qualified pictures.

You don't have to be an Atarist to take part - just remember,
Atari STe can show 16 of 4096 colors at 320*200 resolution.

Prizes: 1. 1500 FIM
2. 1000 FIM
3. 500 FIM

Falcon competitions

Falcon competitions will be held if there is enough interest.
Please contact us beforehand.

PC-competitions

PC competitions are arranged by FC. If you want more information, call
Gore/FC +358-0-427477 (17-22, ask Sam).

Amiga competitions

There will be only one Amiga competition; after all, this is an Atari
Party... Amiga graphicians can try to make their pictures with a smaller
amount of colours this time...

Amiga demo/intro

Rules: You can attend with an intro or a demo. (Word demo means also
intro from now on in these rules.)

All demos will be run on an A500, KS1.3, 0.5Mb chip, 0.5Mb fast.

Demos must be previously unreleased.

One group may attend with several demos.

We don't suggest you to attend with an unfinished demo, but:
The demo must be either released OR you have time to finish
it and you will get the possible prize after you have sent
us a finished version.

Prizes: 1. Asta 2400 EMNP 5 modem + 1500 FIM
2. Midi-interface with cables + 1200 FIM
3. 1000 FIM

Amiga intro/demo competition is sponsored by Man&Man Co.

Music

As said before, music competition is for all computers.

Rules: Music must be in 4-channel protracker module format.
No executable files allowed.
Maximum length for the music is 3 minutes.

Prizes: 1. Midiman midi-to-tape recorder and synchronizer + 600 FIM
2. Midi-interface with cables + 600 FIM
3. 400 FIM

Music competition is sponsored by MS-Music Shop and Man&Man Co.

Happening at the party...

Rave! Friday 23:00-24:00, Teque-in-concert Friday 24:00->
Movies will be shown on big screen.
Various not-so-serious competitions, like hard-disk throwing etc.
We will sell party-socks and -shirts as usual.
Utopos competition. Utopos is a Thrust-like game by Aggression.

Other rules

To give everyone a wrist-strap which indetifies you as a visitor at
Aggressive Party and also indicates whether you can buy alcohol or not,
we have to check your identify certificate. If you don't have any ID
with you, you will get "red" strap and you can't buy alcohol from
restaurants.

You can buy alcohol at our Party, but this doesn't mean you are allowed
to make trouble, neither you are allowed to drink your own liqueurs.
We do not hesitate to contact police. A little note to those who have
had a contact with police during Assembly '93... we know your names and
will not let you enter.

Also selling food, disks or hardware is forbidden. This doesn't mean
we have very high prices for these, in fact, we will sell disks on
non-profit basis, and the food in restaurants is very affordable.

>I get the idea cookies are interrupt vectors? All I know is that
>with before dawn running, cookie.cpx tells me that I am all out
>of cookies and my machine crashes after trying to print from a
>GDOS application in TOS 1.62

The cookie jar is an area of memory that contains information about your ST. There's a pointer in low memory to this area, so that applications can find it.

Cookies themselves consist of two longwords (a longword is 4 bytes). The first is an ASCII cookie ID (four characters). All "official" Atari cookies start with an underscore. E.g. _VDO. The second longword contains the cookie data. It might be anything from a series of bits indicating what sound hardware is available, to a pointer to some shared memory used by a memory resident program.

The last cookie in the jar has a zero ID, and the second longword contains the number of cookies in the jar (including the last, zero, cookie). Thus you can tell how many spaces are left in the jar.

I'm not sure what the connection between a full cookie jar and GDOS crashing is on your machine!

4143. CPP v1.04 released

Newsgroup: comp.sys.atari.st
Date: 1993-09-16 17:19:13 UTC
From: dsb@duke.cs.duke.edu
Message-ID: <748199951@amazon.cs.duke.edu>
Source record: 201038
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Version 1.04 of my stand-alone C preprocessor should now be available
from atari.archive. The main bug fixes over 1.02 (and the short-lived
1.03) are:

- #undef is now handled properly.
- If cpp can't find the specified #include file, it will now properly
say so, instead of trying to open it in the last place it looked.
- The '\xhh' escape sequence was being handled completely and utterly
wrong; it now works properly.

Thanks to Andreas Schwab and Thorsten Roskowetz for pointing out most of
these bugs.

That's already been done on the Atari though...just look at Epic!
Even the old Star Raiders had some similarities (ie Zylons = Cylons ...)
Ah well, it would be great though...I happen to love Battlestar Galactica...
Except when they reached Earth...sorta got really lousy then...

OK! Some help wanted....

Look for Gemview by Dieter Fiebelkorn, a very good viewer/converter for ATARI.

Gemview can cope with *Lots* of different picture formats.

Here is a list from GVIEW201.LZH, old!!!, uploaded from FTP :-)

Untersttzte Bildformate:
""""""""""""""""""""""""""

"GEM-View images [*.GVW]" (internes Format)
"GIF Images [*.GIF]"
"JPEG Images [*.JPG]"

"Imagelab Images [*.B&W]
"STAD Images [*.PAC]"
"IFF Imagefiles [*.IFF]"
"HAM Hold & Modify [*.IFF]"
"MS-Windows Bitmap (*.BMP, *.RLE)"
"OS/2 Bitmap (*.BMP)"
"GEM-(X)Image Files (*.IMG)"
"GEM-Metafiles (Vector) (*.GEM)"
"Neochrome Rasterfiles (*.NEO)"
"Art-Director Rasterfiles (*.ART)"
"Degas Images (*.P[IC][123])"
"Tiny-Compressed Images (*.TN[123Y])"
"Doodle Monochrome Rasters (*.DOO [640x...])"
"Spectrum 512 Images (*.SPU, *.SPC)"
"Portable Bit Map [*.P[BGP]M]"
"MacPaint Image [*.MAC]"
"PC Paintbrush (monochrom) (*.PCX)"
"X Bitmap-File [*.XBM]"
"1st Word Files [*.DOC]"
"Load as Text or Hexdump [*.*]"

4148. Drawing/Painting packages

Newsgroup: comp.sys.atari.st
Date: 1993-09-16 20:21:40 UTC
From: ehood@convex.com
Message-ID: <1993Sep16.202140.25247@news.eng.convex.com>
Source record: 201008

Hello there,

I'm looking into drawing/painting packages for the ST. There are quite
a few, so I'd thought I query the net for others knowledge about
drawing/painting packages for the ST. Here is list of functionality
that would be nice to have:

o Various graphical image support (e.g. JPEG, TIFF, GIF, Atari
formats, etc...).
o Vector graphics and formats (e.g. CGM).
o Full color support, regardless of the display. I.e. I can
put colors in a image even though the colors cannot be
represented by the current display.
o Unlimited (except by memory) image size.
o Drawing of smooth curves (e.g. Bezier, Splines).
o Other standard drawing tools like fills, airbrush, blending,
etc ...
o A decent price.

E-mail replies preferred, please.

Thanks ahead of time for anybody who responds. If there is enough
interest and response, I can post summary.

Date: Wed, 15 Sep 93 22:00:05 PDT
From: Jeff Beeghly <a-jeffbe@microsoft.com>
To: dud@u.washington.edu
Subject: Request

Jeff Beeghly, a friend of mine, asked me to post this. Any help is appreciated. You can reply to me and I'll forward it to him, or (preferrably) you can send it directly to him at <a-jeffbe@microsoft.com>.

I'm currently using GNU C (not GNU C++) for my development. I have two problems and I'd appreciate some help.

1) The executable *.PRG files that are created by GNU are HUGE. I've compiled simple GEM applications under GNU and under the Mark Williams C compilers, and the program that was created by GNU is about 30k - 40k larger.

2) Some of the programs that I'm creating I'd like to market. I figured that I'd release a demo of it, and put some password protection techniques in it. I heard that there is a utility called STRIP. From what I understand, when I run STRIP, it will remove all of the variable names from the program.

I'd like to use the STRIP utility in order to reduce the size of my application, and make it more difficult to hack in to my program.

I'd like to know:
1) Is STRIP available? If so, then where? I tried looking for it but I couldn't find it.

2) How do I use it?

e.g. lets say I have 2 C files for my application. When I compile, it looks something like this:

```
gcc -c foo1.c
gcc -c foo2.c
gcc -o example.prg foo1.o foo2.o -lgem
```

In order to use STRIP, do I

a)
```
gcc -c -strip foo1.c
gcc -c -strip foo2.c
gcc -o example.prg foo1.o foo2.o -lgem
```

b)
```
gcc -c foo1.c
gcc -c foo2.c
gcc -strip -o example.prg foo1.o foo2.o -lgem
```

c)
```
gcc -c foo1.c
gcc -c foo2.c
gcc -o example.prg foo1.o foo2.o -lgem
strip example.prg.
```

Any help will be appreciated, but precise EXACT steps would be really, really helpful.

Thanks in advance,

Jeff

4150. Adaptec ACB4000A SCSI to ST506 drive controller

Newsgroup: comp.sys.atari.st
Date: 1993-09-16 20:51:58 UTC
From: ronnie@xerox.com
Message-ID: <1993Sep16.205158.19659@spectrum.xerox.com>
Source record: 201010

If anyone is sick and tired of their slow small MFM drives on the Atari ST series (older) and wants to get rid of their hard disks (and controllers) I am looking for the Adaptec SCSI to ST506 controller card. I need several and may be willing to purchase your MFM drive as well. (you can then upgrade yourself to a larger SCSI drive without the intermediate electronics.)

Please respond if interested to gfl.xkeys@xerox.com

>distribution with Speedo GDOS. The fontnames are recognized
>and the fonts are installable, but they don't work.
>Who cam give me informations ?

The fonts have the wrong customer number; Bitstream assign font encodings
on a per-customer basis, the X11R5 public fonts use neither the retail
customer key nor the Atari key so are unusable by Speedo.

>Funny, my TT has TOS on 2 chips. I'd love to see TOS 4.0x come out in a
>2 chip
>set so I could upgrade my own.

Sure you don't have a repainted Mega STE?

Seriously, all TTs I've seen have TOS in four ROMs, since they access their memory 32 bits wide.

Besides, TOS 4.0x won't run in non-Falcon machines, since it expects Falcon hardware.

Source record: 201015

The Miracle is also available for Mac and Amiga.

Chances are there is an Atari version

There is NOT an Atari version of "Miracle Music System." I called the company a while back, and they do not have any plans to make one, either. They also told me that the "Miracle" system does not use MIDI, but uses another way to allow the keyboard to talk to the computer. . . .

P. S. I might also add that the "Miracle Music System" requires the use of their 48 key keyboard. It will not work with a Yamaha, or Casio, or whatever. I believe the keyboard is MIDI compatible, and can be used with other applications, but it is not a really high quality keyboard. It would be nice if they had a version for the Atari - I'm sure the ST and Falcon could easily run the application. If there are enough people out there with Atari Computers (ha, ha) that would call the company to ask for an Atari version, they might consider it, since they do make Amiga, Apple, IBM, and even Nintendo versions.

4158. Re: 1.44Mb drives on Mega STe

Newsgroup: comp.sys.atari.st
Date: 1993-09-16 22:46:00 UTC

>next to the 68882-socket. I didn't have that strap, and then I
>couldn't enable 1.44 MB and had too change the whole board :-(

To make things clear:

Only VERY early Mega STEs need an additional strap. These can be recognized:
they don't have a jumper next to the empty 68881 socket. Later versions don't
need any fix to the board.

Others might need a modification in the power supply (Cxxxxxx-001 power supply
only, the -002 already has the modification). Remove the center one of the five
screws holding the power supply PCB and isolate the socket.

Then, there's a PAL C301901, also Rev. -001 has to be replaced by -002. Buy
this one from your Atari dealer.

The WD 1772 chip has to be replaced by an Atari AJAX controller chip.

These are the modifications for older Mega STEs.

And now, for all Mega STEs:
Flip DIP #7. Replace the Epson SMD-380 disk drive by an Epson SMD-340.

btw, the Atari High Density upgrade kit for Mega STEs includes all the chips
needed.

bye, Peter

4159. Re: STbook ?'s

>I don't know about harddisk sizes, but all ST Book models have had 4
>megs of ram, because it would have been difficult to upgrade later. The

No, they didn't. ALL ST Books have 1 MB.

>As far as I know ST Book has all ST interfaces, but for most ports it
>has not the real things. It has downsized ports, to save space. Nothing
>that can't be fixed with the proper cable though.

No, they don't. They have a System Expansion port, DMA, MIDI, serial and
parallel. Nothing else. No external monitor, no standard size cartridge port
(how should it - the cart port is higher than the entire ST-Book...).

>Nope, maybe the 2.5 inch IDE drive can be exchanged. I am pretty sure
>that it can be.

It could, but you'll have to format it OUTSIDE the ST-Book, using a Falcon or
an ST w/ IDE board. The BOOKFMT.PRG on the Book's ROM-Disk can only format the
40 meg Conner drive that's in there...

>P.S. ignore the childish sinclair post ...

I think there's one more post to be ignored...

>Does anyone know of a consistant method of re-fueling in the original
>Starglider??? I can get it right some of the time, just trying to fly
>and stop between the two energy towers. Is there a trick to getting it
>right everytime to avoid having to fly away and come back to try again?

Fly at lowest possible speed and lowest possible altitude. Pass between the two
energy towers, heading towards the third one on the other side of the bouncing
energy lines (or whatever these lines are).

But be careful - you're extremely vulnerable as long as you're refuelling.
Better clean up the area before you do so.

>So you do some other sort of decompression, that's all. One method
>which comes immediately to mind is a delta-type animation compression
>scheme, which works very well indeed for the kind of action you've
>got in MK.

You have too much faith, not enough practice. The more similar frames
are in an animation, the easier they are to delta-frame compress... but
also, the more frames you need. In MK, even in the arcade version,
the frames are quite different (it's really low-grade animation).

MK has been done on a small-memory machine, and as posters here have
said, the graphics is pitifully weeker than the arcade version.

>BTW - if you think that the images in MK are simply scanned
>photographs, with no "tweaking", you're a bit naive.

Of course they are tweaked! In fact, it is my suspicion that the
arcade graphics are colourized & touched-up black&white originals.
Have a look at them - very little hue variation within the image
elements. I don't blame them either - I'd do it that way too.

4171. need serial to parallel pgm

Newsgroup: comp.sys.atari.st
Date: 1993-09-17 05:07:43 UTC
From: glenn@lightning.nsc.com
Message-ID: <CDHFKw.Eyn@nsc.nsc.com>
Source record: 201027

O.K. this may sound kind of goofy but...

I need a program that will copy data from the serial port and send it out the parallel port WITHOUT CHANGING IT IN ANYWAY.

I've got a graphon X terminal, at home, that I use to log into my sun workstation at work. The graphon has a serial printer port but my (now very old) SG-10 printer is parallel.

Yes I know I can buy a serial to parallel converter, but I've got two of those at work that never did work well and now don't work at all. Besides, I've got this (now kinda old) atari st520fm with 1 meg 'o ram that just sits here doing nothing (not to mention the eight bit that doesn't even get used for games anymore).

I just spent all evening trying to get flash or uniterm to do this but they always seem to corrupt the data somehow. I tried ascii download, printer on etc.

I don't have any languages (well I guess there is a basic somewhere, oh yea and Alice pascal) so If someone could whip somthing up in gcc and send me a uuencoded binary that would be great. Ideally the serail port should recieve data at 19.2Kbaud (or faster it the st can do it) and use DSR handshaking.

I figure I can use ghostscript -sDEVICE=epson to print postscript files this way.

Rgds,
Glenn

4172. Re: where to sell shareware?

Newsgroup: comp.sys.atari.st
Date: 1993-09-17 08:39:00 UTC
From: richard.hecker@canrem.com
Message-ID: <60.36989.4514.0N183DEE@canrem.com>
Source record: 201044

Dave,

I understand all about registered shareware and the pitfalls involved with it. But I find that games tend to get far less registrations than utilities and such do. I recently received a "registration" for my Ishar: LEgend of the Fortress Survival Kit. It wasn't crippled in any way, it was the whole kit and kaboodle; only those who wanted to be nice to send me a registration fee out of the kidness of their hearts did so... and I did receive a few. But what do you think about utilities? I'm currently writing an ANSI screen editor that does full 80 columns in 16 colours with all sorts of nice little fiddly bits to play with, and so far from the people I"ve talked to over the Internet and various other sources are generally positive about the whole thing, and if I had to make a forecast I'd say that I'll probably receive enough registrations to make the whole project worthwhile. Granted it is the first of its kind on the Atari platform, and firsts usually do steal much of the 'business', but even given that I feel that so far the response will be relatively positive. Certainly not what I would call lucrative, a nd I certainly don't plan to make big money on it, but with what the program does, and what it "restricts" in order to encourage registration appears to be fairly adequate, judging from what I've discussed with people about what kinds of things unregsitered programs do to annoy them or encourage them to register. Mainly I'm doing this program for me -- I wanted an ANSI editor, none existed, so I'm writing one. But I like to share such programs with everyone, and it would be nice to see some registrations to see what the response is like; to find out how many people truly do want a good ANSI editor for the ST. The preliminaries suggest such response will be quite positive.

>...
>my problem is that it sometimes rather erraticall loses
>the note off in step (4).
>...
>anyonw has any idea what's going on?
Either your code is losing bytes, or the ST is losing them for you. Taking
the first possibility first:

1) Your loop that is reading the bytes may be slowish, and, if the keyboard
is sending vast amounts of aftertouch data, you may lose data
due to a full input buffer (128 bytes by default, I think).

. Code your loop as tightly as possible.
. Increase the MIDI buffer size, see Iorec.
. Consider handling MIDI interrupts yourself, so
that you bypass the slow Bconstat/Bconin calls.

2) As I said above, it may also be possible that the ST is losing data
for you; the keyboard interrupt handler is so slow that it can block
out MIDI interrupts for long enough to lose bytes. This is especially
likely to happen if you wiggle the mouse when waiting for MIDI data
(the mouse is handled by the keyboard controller).

One workaround is to disable interrupts from the keyboard controller, but
this may not be ideal (not keys, mouse etc). This is the route I took
in a program that read and processed sysex dumps from a D50.

One reason that commercial MIDI software is so notoriously incompatible with
other things is that they end up having to rewrite the mouse/keyboard/MIDI
etc handlers in order to avoid the sort of problems that you are having.

It's all a real pain when you only want to write a 10-liner to do some
simple MIDI processing...

Hi!

I basically got three MATRIX COCO Graphic Cards basically new as they have hardly been used. I'm asking 369 U$D for each card, I guess they are negotiable too. They are basically 8 bit Card's.

I've also got a brandnew set of Didot and Retousche for Sale..offer's anyone? (I mean considerable ones *;)*).

Personally I would recommend the NOVA Graphics Card above all the Matrix anytime...which is why I am selling these Matrix Cards *grin* because for basically 200 U$D more you already get faster and more color's, but it's still a very good Card...(the Matrix that is) and it fit's nicely into the VME Bus of your TT/Mega STE.

Ps: all the documentation is in German too...

Think NOVA! :)

>Why can't I use the Speedo-fonts which are in the X11R5
>distribution with Speedo GDOS. The fontnames are recognized
>and the fonts are installable, but they don't work.
>Who cam give me informations ?

Alex Kiernan explained this a while back -- I'll try to get it right :-)

Apparently, Speedo fonts are encrypted. The encryption matrix is compiled into the font engine, so you can't change it. Each licencee of the font engine gets an ID, and this is used to encrypt the fonts for that particular licencee. Therefore, there is an Atari Speedo font ID for the fonts supplied by Atari with Speedo.

The X11R5 Speedo fonts are encrypted with a different ID, so you cannot use them in the Atari licenced Speedo engine. End of story.

>on it's own is it? Alone it is a re-write of the AES and will run in NeoDesk
>(DUH! I wonder why ;)) and also MultiTOS where it will then support
>Multitasking.

Geneva is a multitasking system all on its own. Geneva replaces the AES in such a way so as to allow event based multitasking for GEM programs.

Furthermore, Geneva does not in any way require NeoDesk. Because the built in desktop is incompatible with a multitasking environment (This is why MTOS also replaces the desktop), Geneva does not have a desktop or shell. Many people will find this to be inconvient, so we do recommend using another desktop or shell. (We just happen to think NeoDesk is the best one. :)
I have heard that Teradesk (sp?) works with it, although many shells will not work correctly with Geneva until they are made compatible with a multitasking environment. For instance, Hotwire works with Geneva, but because of the way it executes programs, it can only run one single tasking application at a time. The changes necessary to make most shells work correctly with Geneva are a subset of the changes necessary to work with MultiTOS, and in most cases somewhat easier.

It is also important to note here that you don't have to have a replacement desktop when running Geneva. You can run programs directly from Geneva's menu, and because Geneva's enhanced file selector has copy and move functions, you can also do that without a shell.

Although the current version of Geneva does not support MiNT, when it does,
it will also support memory protection. Since all MultiTOS does is terminate
a program which violates memory protection, Geneva already does a better job
in many cases. In most of the cases I've seen, Geneva is much better at
cleaning up after an application terminates abnormally.

One thing I forgot to mention in my last post on this subject...
Although it is true that Geneva cannot multitask TOS applications without MiNT,
Dan did write a TOS in a window program for Geneva that is really good.
It allows you to switch to other tasks when the TOS program is waiting for
input (in most cases). So, for instance, you could start up your favorite TOS
command line program, and just leave it sitting at a prompt in the window while
you do other things. If the window is in the way, you can put it to sleep
until you need it.

4186. Minix on Atari ST

Newsgroup: comp.sys.atari.st
Date: 1993-09-17 14:04:09 UTC
From: cabp09@ccsun.strath.ac.uk
Message-ID: <27cg4p$nff@loch2.cc.strath.ac.uk>
Source record: 201043
Cross-posted to: comp.os.minix,comp.sys.atari.st

Are there any Atari Minix users out there ? I would like some opinions
about Minix for the ST, and any info/opinions you might have about it.

I am interested in getting it for my ST in the house (money might be
a problem, but on the other hand, I only have one more year of
student poverty to go..), but I have an OLD ST !!

It has an upgraded ROM to TOS 1.4 (I think) and has 1 Meg of memory. I
also have a slow, noisy HD (Atari's own make, HD204, I think).

Has anyone had problems with Minix on the above equipement ??

Ta,
Dave.

Have you been running the Diablo emulator program first? I don't use the CSTeX SLM driver, but with the one I do use you only get blank pages unless the Diablo program is run first. You only need to have one (Diablo) font loaded - it's just a minimal installation (though it is annoying to have to do it).

You have to keep the SLM on all the time (I keep the back cover of mine open, to keep the heater/fan/noise off), unless you get some hardware box (I've forgotten the name right now). You can run into serious problems with the HD's if you don't keep the SLM on _always_.

I really don't think you can blame the hugeness of WindozeNT on OO
programming; it's the 999 million kludges required to run crummy hacked
programs and run on the kludged ISA architechture. Supposedly it's so
huge because it's portable; I've never heard of a unix kernel that
requires 12M of RAM just to boot.

> operating systems?)

For all of my complaints, I'd buy a Falcon040 real quick... I like the
way I've got my ST set up, and the latest version of GCC/G++ for OS/2 is
2.3.3; no templates! :-(The more I look at things, the more
attractive a NeXT (a real, black one, not NeXTstep for Intel) or Sun is.
Then again, I'm always assuming that the Falcon040 wouldn't have the
same bozo design problems the TT030 and Falcon030 have (the TT's
essentially a 16Mhz machine with a 33Mhz CPU grafted on; the Falcon's
barely powerful enough to drive its own graphics modes, and crippled by
a 16-bit bus).

It's been over a YEAR since the Falcon announcement, and the (apparent)
efforts to rebuild the dealer network... Do they have a dealer network
yet? No way. I'll bet you can count the number of new dealers on your
fingers; you can't really count music stores carrying the machines,
since #1, people don't go to _music_ stores when they want to buy a
computer, and #2, music store employees generally know almost nothing
about computers.

Not to mention that:

a) Atari's unix was never released to the public, only a few developers
b) Atari's X was too slow to be used (or so Atari claimed when they were
explaining "a" above)
c) Atari's unix was priced up there with real unixes for workstations and
servers; they certainly don't have an appropriate image for selling
workstations or servers

Whatever benchmark you're using is lying to you and using a test that
fits completely into your CPU's cache. By all accounts (from ICD, Bob
Allen, etc... all of the 16Mhz 68000 upgrade makers) the performance
boost you'll see is about 30% or so, _depending_on_the_application_.
Try running a few dhrystones and tell us what you got; try raytracing a
few images (us POV-Ray on the basicvue.pov at 320x200 and say how long
it took... it takes my ST 4 hours to render the image using +a0.3 +q9;
takes a '486/33 with no cache 56 seconds).

I know several dozen Atari users; two have TTs, one has a Falcon, the rest
have ST/STe machines (one of which has a 68010 in it).

> The Falcon *is* selling. It *is* being supported. There *are* many 3rd parties

That's Atari's official chant. Behind closed doors, they're saying "The
Jaguar *will* sell. It *will* be supported. There *will* be many 3rd
party developers."

> When will all you US/Antipodean people realise that just because the Atari is
> dead in your neck of the woods, it isn't the case elsewhere.

Funny, given the location of Atari.

PD/SW software doesn't sell machines.

That's Atari's fault. If the company wasn't run by idiots, the machine
would've been available when they said it would be.

Lots of people are probably using the Heat and Serve C compiler. Because it is cheap and reliable. But since Ian Lepore the writer of HSC is currently not active on the internet we can have no support from the author.
I have found that I can learn lots from other HSC users and expect that others can learn from me and others too. So why not start a mailing list. I could set up a mailing list, but there has to be a basis to do so, with only a few people interested it makes no sense to create a mailing list for asking question, giving examples, announcing utilities etc. etc. So if anyone is interested e-mail me (error@stack.urc.tue.nl) and I'll see if there is enough interest to create a mailinglist. Perhaps even a small ftp area specifically for HSC.

Erlend.

In article <60.36989.4514.0N183DEE@canrem.com> richard.hecker@canrem.com (Richard Hecker) writes:
> I understand all about registered shareware and the pitfalls involved
>with it. But I find that games tend to get far less registrations than
>utilities and such do.

Absolutely! Games are more frivolous -- you don't *need* a game. By the same token, people often don't feel that's it's necessary to pay a game author. The game author's not really providing a "useful" service -- just a source of time-wastage. There's also the common belief that games are easy to write, so they don't require very much work compared to, say, a text editor. Anyone who's tried to write a game (especially on the ST) knows how wrong that is. But you can't change what the general population thinks so easily.

I've always wondered about piracy rates for commerical games vs. other kinds of commerical software.

>I recently received a "registration" for my Ishar: LEgend of the
>Fortress Survival Kit. It wasn't crippled in any way, it was the whole
>kit and kaboodle; only those who wanted to be nice to send me a
>registration fee out of the kidness of their hearts did so... and I did
>receive a few.

Yup, there will always be nice people who will register just ... well, to be nice! Maybe in a really huge market like the clones have, you could support yourself on these nice people. But I suspect that you can't in the ST market, because there just aren't that many potential registrants anymore, even if a higher percentage of them are "nice."

But I guess I don't see any *disadvantage* to releasing a partial product and then sending out the full version upon receipt of registration. The users will like it less, but then again they're getting *something* for free, so it's kind of hard to take grumbling about it seriously. For utilities there's usually an obvious way to "cripple" the shareware version (without making it totally useless) -- remove some of the more advanced features, compile it without any optimization so it's slower (grin) -- easy things like that.

The bottom line is that you should pick the method that will make you more money for your effort, because the more you're compensated for your time, the more you'll be inclined to continue doing it. In the long term it's a win for the users even if some may view it as "annoying" or "money-grubbing." The ST market desperately needs software authors now; so many people have bailed to other platforms.

>I'm currently writing an ANSI screen editor that does full 80 columns in
>16 colours with all sorts of nice little fiddly bits to play with ...
>
>Certainly not what I would call lucrative, a nd I certainly don't plan
>to make big money on it, but with what the program does, and what it
>"restricts" in order to encourage registration appears to be fairly
>adequate, judging from what I've discussed with people about what kinds
>of things unregsitered programs do to annoy them or encourage them to
>register.

The goal is to distribute your software and have people use it, while avoiding the common trap of leveraging yourself financially or emotionally to do it. I've found that shareware authors often write their wares for the wrong reasons:

1. expect to get rich
2. expect to become famous
3. think shareware is a path to commerical distribution

None of these things is likely to happen. There are counterexamples, but they're rare. If you write shareware for one of these reasons, you'll probably be disappointed when you get to the end of the road.

If you have other reaons, maybe you'll be quite happy with how it turns out -- it's obviously a personal matter.

>Mainly I'm doing this program for me -- I wanted an ANSI editor, none
>existed, so I'm writing one. But I like to share such programs with
>everyone, and it would be nice to see some registrations to see what
>the response is like; to find out how many people truly do want a good
>ANSI editor for the ST. The preliminaries suggest such response will
>be quite positive.

OK, but realize that what you're doing here is providing a service essentially free of charge, just because you're being nice. Nothing wrong with that at all, but it *will* take a lot of gratis time and effort. The main downside I found with shareware was that I ended spending a lot of time answering mail, hand-holding, fielding requests for special customizations, etc. Not bad in itself, but these things do take time away from other things (like hacking, which is presumably what you really want to be doing, right?)

There's no simple answer to the question of "should I spend time writing shareware?" But I'd have to say that my personal opinion is that the ST shareware market is really rough now -- not many users left, and most of those left tend to feel that everything should be free. (Not a flame, just an observation.)

> in a program that read and processed sysex dumps from a D50.

One major caveat here: From what I recall, SOME ST's lose MIDI data
and SOME don't. The early ones tend to be the worst. This is a
hideous problem for software authors who want their programs to
actually work on ST's they don't own. (grin)

When I was writing a MIDI-networked game a couple years ago, I found
that the only thing I could do to deal with the problem on my ST was to
add code to resync the network when bytes got lost. I don't think I
ever tried totally disabling interrupts, since I needed joystick input.

In any case, BE VERY WARY of the ST in this regard. I wasted an
enormous amount of time because of this, and never really solved the
problem...

An external power supply to the SLMC804 (the interface).

> For me, the normal way to deal with all the noise is to open the back

Atin Electronics Leiden still exists, their solution works fine.

The Miracle system uses RS-232 serial connections instead of MIDI. This means
you MUST use their keyboard. Where as with MIDI you can use any MIDI keyboard.

>engine gets an ID, and this is used to encrypt the fonts for that particular
>licencee. Therefore, there is an Atari Speedo font ID for the fonts supplied
>by Atari with Speedo.

True - Atari have ID 435, and speedo-gdos will only recognize fonts with
this ID.

>The X11R5 Speedo fonts are encrypted with a different ID, so you cannot use
>them in the Atari licenced Speedo engine. End of story.

NO - The X11R5 speedo fonts are _not_ encrypted! All keys 0 and so is the
ID of the fonts and engine.

The real strange thing about X11R5 Speedo engine is that it only uses 2 of
the 8 keys, and it is only a simple XOR encryptionation.

[It was a simple task to write a program that could deduce these 2 keys for
a given font, unfourtunary Atari don't use the same encrypt algorithm,
that is probaly a smart move!]

After reading about PowerDos and Geneva on this group, I decided to
give PowerDos a try. I found a copy of version 1.02 as powerdos.zoo
in the Cli directory on atari.archive.umich.edu, but there seems to ba
a lack of documentation with it. Is this the newest version? (Until
the geneva-compatible one is released, that is...) And is the
author/authors on the net?

If anyone has any documentation for this program, please tell me...
There are text files included for all the utilities, but not for the
program itself...

thanks!

.s.

(waiting for the new version...and for Geneva...)

4208. Re: where to sell shareware?

Newsgroup: comp.sys.atari.st
Date: 1993-09-17 19:22:18 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <CDIJJL.8o@news2.cis.umn.edu>
Source record: 200952

In article <27cr9oINNer@life.ai.mit.edu>, dmb@case.ai.mit.edu (David Baggett) writes:
>But I guess I don't see any *disadvantage* to releasing a partial
>product and then sending out the full version upon receipt of
>registration. The users will like it less, but then again they're
>getting *something* for free, so it's kind of hard to take grumbling
>about it seriously. For utilities there's usually an obvious way to
>"cripple" the shareware version (without making it totally useless) --
>remove some of the more advanced features, compile it without any
>optimization so it's slower (grin) -- easy things like that.

I would like those who take Dave's suggestion here to make it clear in
the documentation (and in any upload descriptions to on-line/FTP archives),
that such software is a 'demo' of the full program. Taking such precautions
(for games, a 'playable demo' of one or two levels, for example) will leave
the prospective user feeling a lot better about spending time and/or money
in order to receive the download.

>The bottom line is that you should pick the method that will make you
>more money for your effort, because the more you're compensated for
>your time, the more you'll be inclined to continue doing it. In the
>long term it's a win for the users even if some may view it as
>"annoying" or "money-grubbing." The ST market desperately needs
>software authors now; so many people have bailed to other platforms.

You also might want to consider 'advertising' your shareware programs by
sending copies to ST-oriented magazines for review (make sure you don't send
a crippled 'demo' for magazine reviews, but clearly mark that this is a
'full' program that SHOULDN'T be distributed), and also to as many PD
libraries as you can find for the ST. Also upload it (and solicit reviews)
to the on-line services and/or Internet FTP sites. One of the things that a
PC-oriented shareware author must do is sent out copies to as many sites as
possible --- one shareware-oriented text suggests that as many as 300 copies of
a disk need to get out to various distributors of shareware in order for any
money to be made.

Don't just put it on an FTP site and expect people to come calling. You have
to hustle a bit in the shareware business.

At the same time, we really don't need "Yet Another Text Editor" as a shareware
product. Nor do we need another Shell program, or DeskTop replacement program,
etc ... (UNLESS you've done something spectacularly different!). Look at areas
which haven't been filled yet -- here are ideas I've been kicking around for a
while, feel free to use them:

An outline program that will create text importable by the major word
processors. While there are programs that do some of the things an outline

program does, none match the utility of such programs on the Macintosh, for example.

"How-to" programs that teach or instruct. My favorite idea is putting together an aquarium program that allows you to put in different species of fish (LOTS of species), and see how the tank looks after a while. You can add things like fish diseases, over-feeding/under-feeding, competitiveness (try putting some angelfish with the more competive species and see how long they keep their beautiful tails...), things of that sort. As a shareware idea you could offer guppies and goldfish, and charge fees for information and graphics for other fish ...

>>I'm currently writing an ANSI screen editor that does full 80 columns in
>>16 colours with all sorts of nice little fiddly bits to play with ...

(The bit above wasn't written by Dave, it was in the original message to which he is responding.) Just an aside here -- while you may think that an ANSI screen editor would be neat as a shareware idea, be sure you look around to find out how many people would actually be interested in it first. I suppose it might be useful for a telecommunications package, or for a BBS operator, but I wouldn't be interested in such a program, and I'm not too sure that many others would be either.

It's similar to the Ishar editor someone put up on atari.archive --- I don't own Ishar, don't want to purchase the game, so I wouldn't be interested in the program. You don't get paid by people who cannot use your program, even if the 'potential' number of ST owners were huge.

>>Mainly I'm doing this program for me -- I wanted an ANSI editor, none
>>existed, so I'm writing one. But I like to share such programs with
>>everyone, and it would be nice to see some registrations to see what
>>the response is like; to find out how many people truly do want a good
>>ANSI editor for the ST. The preliminaries suggest such response will
>>be quite positive.

(Again, the above isn't Dave, but the person he's responding to...)

Consider making it PostCardWare (like ST Zip). Then, when you update the program, you can offer it to those who respond for a small fee.

Where are you getting your preliminary information from? The Internet isn't exactly the place the majority of your potential customers hang out.

Source record: 200962

Hello,

I'm having a terrible time here, and it's probably the same problem that
many people have experienced who don't have hard drives. The Problem:
I cannot unarc any archive that is larger than 300K, on my 720K disk
drive. Can I specify a different DEST to the unarc program, say to
drive B, with an empty disk in it, and have the archive prog, and
archive on drive A?? Does anyone know of a shell that will allow you
to extract only certain files, that is compatibel with ARC602, and
LHARC2?? Not unlzh125!

Thanks in advance!

Chris.

4210. followup and new MTOS problem

Newsgroup: comp.sys.atari.st
Date: 1993-09-17 21:06:58 UTC
From: michael@tapestry
Message-ID: <27d8tiINNa1q@ymir.cs.umass.edu>
Source record: 200965
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

A few days ago, I posted a message describing a problem I had while trying to install MultiTOS. A couple of people sent mail to me saying that the install program in MultiTOS doesn't work with TOS 1.2 (maybe other lower TOS's as well). Quality software, eh?

Anyway, I think I managed to get the thing installed. First, I created a "multitos" folder on my c drive, then copied the files from the folders on the distribution disk to it (I think I skipped the accessories.). I copied mint.prg to the auto folder and rebooted without any other programs or accessories, and it came up with MultiTOS. Double-clicking on a TOS program didn't work when I did that, so with the semi-working MultiTOS up, I deleted the c:\multitos folder and ran the install program again. Then I rebooted, and MultiTOS seemed ok.

At this point, I'm having new problems. First, the documentation that came with MultiTOS is abysmal. I'd like to find documentation about how to customize the installation and what the possibilities for customization are. Does anything like this exist on the network, or do I have to buy the developer's docs to get the information?

Specifically, I'm looking for: gem.cnf file options, any mint.cnf options that aren't listed in mint.doc, and how to autostart GEM programs under MultiTOS.

I've been trying to get NeoDesk 3.03 to autoboot, but the best I've been able to get is to be able to start it manually after MultiTOS is booted, and then I can't launch any programs from NeoDesk. I've tried all of the following together: neoload.prg in auto folder (I tried putting it before and then after mint.prg.), added c:\neodesk3 to the path variable in gem.cnf, and added exe to the gemext variable in gem.cnf.

I'm really at the end of my rope with this thing, and I'm just about ready to wipe it off my hard disk and ship it back.

I'll appreciate any help.

Thanks,

Michael Kieras

Hello Rasmin,

there is a programm called GemView, which is a file viewer. but it can also save pictures. With this program it should be no problem to convert your GIFs into (for example) XIMGs. The current version of it is 2.48 as far as I know. It should be available at many mailboxes in Germany. (The Resources and on-screen-texts are in english.)

Some information on the program:

Status: Shareware
Hardware: Atari ST/MST/STe/MSTe/TT/Falcon030 (all resolutions)

Bezugsquelle: MausNet Maus HH
ftp.Germany.Eu.net, atari.archive.umich.edu

You can also get it here::

hi!

ogal@cix.compulink.co.uk said that he thought that the internal x y and z modem used in connect were the best. I used conNect and i can tell that with my version of ConNect (2.20) and with my TOS it didn't work at all, I just got time-out.
I've heard that it is a problem with the internal xyz-modem on all ST's and that it only works when there is computer running conNect on the other side of the line.

Message-ID: <1993Sep18.034937.13348@alw.nih.gov>
Source record: 200932

HELP NEEDED WITH A SUPRA HD! I got a used 20MB Supra HD. The controller seems to work ok since I was able to format the disk, but it was so full of bad blocks as to be unuseable. So I took out the drive and put in a 213MB maxtor drive (213SY). Now, however, I can't format the disk. The SUPFMT.prg utility (for formating hard drives) says

"DMA device is not responding" Current DMA numbers are:
SCSI: 0 LUN: 0

The Maxtor drive has a jumper to set the SCSI device #, and I checked to make sure this was set to device 0. There is another jumper to select single ended vs differential SCSI signals. It is currently set for single ended. Can anyone tell me how to use this drive with the Supra controller? Is there an email address for Supra tech support?

Well then, without further ado, here are the instructions for hooking up a
PC style bus mouse to an ST. The PS/2 style DIN connector is different from
that described below, but perhaps you can still use the information.

---begin included text---
Subject: Here's how to hook a MicroSoft Mouse to a ST
To: info-atari16@score.stanford.edu

Well, here is how to connect a Microsoft Mouse to an Atari ST. (520/1040)
The Atari has a 9-pin D-type connector. The Microsoft Mouse has a rather
strange connector on the end. To prevent having to cut the mouse cable up,
I made this adaptor. If you still can't follow it, please let me know and
I'll try to redescribe it. This does work for me. I've been using it for
6 or so months now with no problems at all. It does take some soldering
skills, so if you're not so hot at soldering, find a friend to help.

As far as I know, this does not effect your Atari's warranty. However, I
have not asked Atari. :-)

Atari ST Microsoft Mouse ST expected signal
----- -- --------- ----- -- -------- ------
1 5 XB
2 3 XA
3 8 YA
4 9 YB
5 N/C N/C
6 2 Left button
7 N/C +5VDC (N/C)
8* 6 and also tie to pin 1 Ground
9 7 Right button

* = I am not sure why I have pins 6 & 1 tied together, but it does work.

The Microsoft mouse connector looks like this. This is the solder side,
with the leads pointing up.

```
---------------
| 1 |
| 2 3 4 5 |
| 6 7 8 9 10 |
| |
---------------
```

If you can not use the connector, the pins are numbered as follows. This
is the connector side from the Microsoft Mouse plug:

```
/------------\ This is a view at the front of the connector.

Could someone please repost that old sector editor Civilization fix?
I'm getting the infamous and annoying "Bombs when you have a revolution" bug.

Please help - I'm near to being able to build a spaceship!

Thanks,

Brook

Or try the newest version: ftp.cs.tu-berlin.de (130.149.17.7,
mail-server@cs.tu-berlin.de), pub/atari/graphic/Gemview/: gvw_v248.pax
For extracting you need gvw_inst.app, too.

Ciao

Hi!

A while ago I posted a problem concerning the fact that MiNT 1.08/1.09 wouldn't load XFSes (placed in the root of drive C) anymore, where MiNT 1.05 didn't have any problem with them.

I now have created a folder named MULTITOS and have put the XFS files into it, instead of the root of drive C. And it all works well!

Thanks to everyone who helped!

Greetings... - Jan -

4222. Copying large files from a Minix filesystem

Newsgroup: comp.sys.atari.st
Date: 1993-09-18 10:37:42 UTC
From: Jan_Willekens@p12.f202.n281.z2.fidonet
Message-ID: <2c9aee83@p12.f202.n281.z2.fidonet>
Source record: 200906

Hi!

I have a problem with copying large files from a Minix filesystem partition
to a TOS partition or to a folder on the same Minix partition:

I compiled the new MiNTLibs and then wanted to copy the OLB files into my
GNU C LIB folder. The small iio16.olb file (+- 5Kb) could be copied, but
the larger gnu16.olb (+- 109Kb) could not. After is had been read, the
system (read MiNT) crashed. Using cp.ttp there was a memory violation. (of
type private if I'm not mistaken) Using the desktop the system crashed
after the file has been read. The same with kobold. This all under
MultiTos. I also tried it with MiNT alone, but got the same results.

What am I doing wrong?

My config: TT030 4/4, MFS 0.60 pl6, ICD 6.20 HD driver, MiNT 1.09, AES 4.0
(MultiTos).

In article <H.eg.u2qLDu2rM6s@semprini.tdkcs.waterloo.on.ca>,
cherborth@semprini.tdkcs.waterloo.on.ca (Chris Herborth) writes:

[stuff deleted]
} Try running a few dhrystones and tell us what you got; try raytracing a
} few images (us POV-Ray on the basicvue.pov at 320x200 and say how long
} it took... it takes my ST 4 hours to render the image using +a0.3 +q9;
} takes a '486/33 with no cache 56 seconds).

Wow - POVray for the 486 must be incredibly fast!
My DS5000-33 gave the following...

basicvue.pov statistics

Resolution 320 x 200
Rays: 77757 # Pixels: 64320 # Pixels supersampled: 1493
Ray->Shape Intersection Tests:
Type Tests Succeeded Percentage

Sphere 305943 174507 57.04
Plane 150658 66430 44.09
Calls to DNoise: 10
Shadow Ray Tests: 296002 Blocking Objects Found: 5085
Time For Trace: 0 hours 0 minutes 46.00 seconds

... and flops20.c gave the following...

System OS, Compiler CPU/FPU FPU MFLOPS(1)
==========
DEC DS5000-133 Ultrix V4.2, cc -O4 R3000/ 33. 9.9875
Gateway DX2-66 NOTE 041, LINUX 0.99 80486DX2-66 66.7 3.7000
ETEQ i486/33 NOTE 054,Linux0.99.pl2-47 80486DX 33. 1.8096

You can see the difference in MFlops. Maybe POVray doesn't use
floating point - it's a little closer then. By my calculations though
(he says - nitpicking) it ought to take about 69 sec :-) The results
below are from Dhrystone...

CPU MIPS MIPS
System OS CPU (MHz) V1.1 V2.

==========

028 DECstation 5000/133 Ultrix R3000 33 29.2 26.0
029 AMI 80486DX2/66, EISA MS DOS 5.0 80486DX2 66.7 28.0 25.2
042 CLUB Falcon 433, ISA MS DOS 5.0 80486DX 33.3 20.4 18.6
070 Amiga 2000/CSA-MMR AmigaOS 1.3 68030 33.3 3.4 3.6

I put the amiga in for comparison. This is presumably about 2x the mips the Falcon would do, based on its 68030 at 16MHz. Food for thought, perhaps, for those who are upgrading to the "Fast" Falcon 030 ...

Now if Atari ever did bring out a 040 version (lets be generous, and say we'd be happy with a 25MHz model) we get (a) Dhrystone, and (b) the MFlops figures below...

System OS CPU (MHz) V1.1 V2.
Amiga 4000/25 AmigaOS 68040 25.0 22.2 18.7

System OS, Compiler CPU/FPU FPU MFLOPS(1)
Amiga/CSA Magnum Aztec C 5.2a/m8.lib ROPT 68040 25.0 2.6952

Which might not grind the 486/33 into the ground, but it does do significantly better.

Simon.
(who's going to buy a Falcon anyway :-)

In article <gate.VRT30B1w164w@sterbbs.nl> urnash@sterbbs.nl (URI SHIMRON) writes:
>hi!
>
>I've heard that it is a problem with the internal xyz-modem on all ST's
>and that it only works when there is computer running conNect on the
>other side of the line.

This is definately not true. The internal Z-Modem works fine with nearly
any zmodem on the other side. Under some circumstances you have to set
certain options (like force acknowlegd and escapes) to get a good transmission,
but this applies for certain mainframe z-modem installations only.

The internal Z-Modem works fine with at least the following z-modems on
the other line:

GEMSZRZ (by M. Ziegler / ATARI)
RZ/SZ (port of J.Bammi/ ATARI)
XYZ (ATARI)
Stalker-internal (ATARI)
DSZ (DOS)
GSZ (DOS)
Termitate-internal (DOS)
ZMODEM90 (unix)

For instance with GSZ and DSZ on a fast IBM and the Connect Internal Z-Modem
on a TT or Falcon you get transmission rates of 11000 cps (Bytes per Second!)
which is quite fast and not reached by many other implementations.

I am having a hard time getting a good copy of dawn125.lzh I believe that is the latest version with the english docs. I think it may be the lzh is not fully implemented on this system or there is simply a lot of corrupted files with the lzh compression method. I have tried wuarchive.wustl.edu and src.doc.ic.ac.uk with no success. Can someone point me to another archive that carries dawn? Maybe in a zoo or arc compression? I haven't had even 1 lost file with zoo or arc. Thanks for your help!

4232. ACN PD Library Adress

Newsgroup: comp.sys.atari.st
Date: 1993-09-18 15:45:17 UTC
From: ohb@dutsh7.tudelft.nl
Message-ID: <ohb.748367117@dutsh7.tudelft.nl>
Source record: 200978

Hi there,

In this group I read a lot of questions about where to post shareware programs.
You can send everything to the following adress:

- ACN PD Library
- PO BOX 5011
- 2000 CA Haarlem
- The Netherlands
- attn. M. Drost
- (+23)-35 11 00

If you add a little note and a README-file that tells something about the
program, we are more than happy to distribute your games, utils, demos and
everything else through the magazine Atari ST Nieuws.
We have the largest PD Library in Holland (over 1800 titles) and are in close
contact with other mayor PD Libs all over the world.
If you send your programs to us, I'm sure that in a short time it will be
available on different places.

If you also add a short ONNO.DOC with an E-mail adress, I will tell you when
we start distributing it, translate the description I made and also give you
a honest opinion about the quality of your work.

By the way, it will be good for my position if you mention my name.......

Good Luck,

Onno Hardebol

Oh yes, and simply let all the money they have already invested in the
Falcon-line go to waste? Probably not! Why do you think they have continued
making computers thus far?

Talking about 19200bps connection to his modem using Flash:

>It is quite odd to see the modem complete a data transfer
>faster than the computer can update the screen.

It is not the computer, that cannot update the screen at this
speed, but Flash which cannot keep up. The fastest speed Flash is able
to handle is 9600bps.

^^^^^^^^
I get 80% speed increase on average with my AdSPeed. Only programs
that have very large loops will suffer and have a worse performance.

>Try running a few dhrystones and tell us what you got; try raytracing a

^^^^^^^^^^^^^^^^^^^^
Don't forget that a 486 has an integrated FPU, which your ST does not
have. This makes for a VERY big difference.

What are you talking about?! Of course you can count music stores as dealers!
After all the Atari is billed as a _music_ machine in so much of it's
advertising (however much there is). And musicians ARE people after all...
Besides, would you rather have music stores selling rather than _nobody_
selling them?? For your second point, what makes you so sure that music
store employees don't know anything about computers? What kind of a stupid
stereotype is that?? What did you base that theory on? Steve's Music or
what?? If you base *anything* on Steve's, you'd come out of it thinking that
all employees are boneheads!! :)

BTW, (Chris probably knows, but Steve's is a music store in downtown Toronto...
and a very expensive one to boot! :)

4243. BASE TWO files incompatible with TOS 2.xx?

Newsgroup: comp.sys.atari.st
Date: 1993-09-19 01:45:37 UTC
From: cordes@ac.dal.ca
Message-ID: <1993Sep18.224537.16415@ac.dal.ca>
Source record: 200909

A member of my local user group (NSACUG) asked me tonight about the following problem, and I said I would ask here about it, so here goes ...

He has just upgraded a Mega to TOS 2.06 and now finds he can't load data (.TWO) files into the data base program BASE TWO. I recall that the old DBMaster wouldn't run on my MSTE either, and I gather BASE TWO is an update on DBMaster, so perhaps it's the same problem arising in both cases. Anyway, the question is, is there anyway of overcoming this problem? How about translating the .TWO files for some other database program?

Posting here or responses by email would be very welcome. If useful info comes in by email I'll summarize to the net.

Thanks very much for any help on this.

Hmmm. *.gz is a Gnuzip'd file. gunzip or gzip -d should decompress
it.

The only BitStream fonts I've been able to track down from any of the X
distributions were BitStream Charter and BitStream Courier 10-Pitch, in
Adobe Type-1 format.

Being Type-1, which is about 3,000,000 times more common than Speedo,
they won't work with SpeedoGDOS; they work fine with PageStream though.

I disagree. I have tried compiling the same program on my ST. At 8 MHz it
took 62 sec, at 16 MHz it took 40 sec (both include hard disk access for
include files). That's much more than 30%.

Some accelerators use video RAM caching (not sure how), so that an ST is
about 30% faster than a MegaSTE in display.

>to handle is 9600bps.

I use flash 1.6 with a UsRobotics 14.4 faxmodem. I set the Flash
program for 19200 (which is a menu option) and it connects to any high
speed system at 14,400, which is the most my modem can take. If the
19.2 is a menu option, I have the feeling that flash can do it.
It is true that characters sometimes look garbled on the buffer
screen because of inability of the screen to keep up. But I have
found that the data that got to the disk is intact when re-loaded
later.
Maybe there are different versions of Flash.

CL> archive prog, and archive on drive A??

If you have enough memory (1 meg or more), you can try unarchiving from
RAMdisk to drive A: (it's a lot faster!) If you think that is too much
trouble, yes, you can enter a destination path in most archive/de-archive
program's. Just read the manuals for the parameters you have to enter! ;-)

CL> Does anyone know of a shell that will allow you to extract only
CL> certain files, that is compatibel with ARC602, and LHARC2?? Not
CL> unlzh125!

Try XShell... Works really nice! If you don't like that, try one of those
shells where you can enter the parameters yourself! A little work at first,
but it's well worth the trouble!

See ya!

Hi to everyone!

Due to the messages here, I grabbed a copy of Warhead too. Great game!
But I keep getting myself killed by the Berserker (first time you meet him)
He scans all my stuff, sends some message like "Heellllooo" and "Fie fo fum,
I smell an organics blood" then he fires a missile which I cannot outrun.
And logically, next thing I do is explode! :-(

I tried leaving with the escape pod, tried to Quadspace away (in both cases
my mission FAILED!) and just to outrun the missile... Nothing seems to
work! Please help!

See ya!

C>I just got WINX 2.1 from ftp.cs.tu-berlin.de and in all of the docs, I
C>couldn't find any reference to how to change the maximum window limit
C>beyond 8 (the default).

When GEM starts, WiNX switches *all* switches to *ON*. Therefore switch G1 is
set to ON. G1 ON means 40 windows. G1 OFF means 8 windows. So, if you don't
change G1 in your WINX.INF, 40 windows are on. Check, wether the .GLOBAl = -
line contents a 1-. If so, remove the 1-.

BTW, do you use GEMRAM or ROMRAM? If not, WINX can't patch your system.

regards, Jimmy

Nntp-Posting-Host: hunter-02

ok, heres the details of the hardware modification to make to your
ST to get it to work with HD drives.
The following information is from the March 1992 #32 edition of ST FORMAT.
I *might* be able to mail foreign netters postscript or sun raster images
of the actual magazine page. Sorry UK netters- you'll need to buy the mag!

DISCLAIMER: I WILL NOT BE HELD RESPONSIBLE FOR ANY DAMAGE DONE TO YOUR
ST OR DATA AS A RESULT OR SIDE-EFFECT OF THIS MODIFICATION.

8 MHz in

HD detect on Pin 2 on the 34-way IDC cable from the drive.
16 MHz on Pin 39 on Shifter chip
8 MHz on pin 8 of WD1772 (read instructions first)

The standard ST disk controller, the WD1772 chip is clocked at 8 MHz on pin 8, providing the correct pulses for a normal 720K diskdrive. For a 1.44 MByte drive to work at full capacity you need to double this clock speed when reading and writing to high density disks. You also need to buy special high density disks. These are identified by their extra hole. When a high density disk is inserted, the 1.44 MByte drive looks for the second hole in the disk, when it sees this hole it tries to read 80 track 18 sector format, which is way it requires the 16MHz clock. If it detects only one hole, then it requires the 8 MHz clock and tries to read the 80 track 9 sector format.

You have to add the circuit which uses the detection signal from the drive to select the appropriate clock. Pin 2 on the 34-way IDC cable from the drive carries this high density trigger signal. This is a logic 0 for high density and logic 1 for normal density.

[circuit walk-through deleted-- if you can't follow the circuit, don't continue!
-Paul]

Okay, so you've got your clocks, the next problem is what to do with them, you need to open up your ST, locate and cut (eek!-Paul) the circuit board track that feeds pin 8 of the WD1772 (clock in). Use that as the 8 MHz input to the circuit.
Pin 39 on the Shifter chip produces a 16 MHz signal that can be used.
Connect the output of your board to to pin 8 of the WD1772. The existing track has to be cut or else you get a constant 8 MHz signal still coming into the WD1772.
Wires from the Shifter should be as short as possible and, if you can, you should use screened cable to stop any RF interference from the inside of your ST affecting the 16 MHz signal.

IMPORTANT NOTE:

o Not all WD1772 chips are compatible to run at 16 MHz. Due to manufacturing tolerances some are, and some aren't.
You can buy the new STE Ajax chip from Atari (UK phone number 0753 533344) if yours doesn't play ball. Sadly there is no way to detect this before you start.

o Also, when you have two drives, upgrade them both to HD drives, or you'll have problems using the 729K drive when the clock rate is 16 MHz.

Ok, thats all- Paul.

"Well spin my nipple nuts | Internet: ssammy@cs.strath.ac.uk
and send me to Alaska !" | JANET : ssammy@uk.ac.strath.cs
Copy this line into your .sig to protect against flames! [beta version .2]

//
//
As I said this may not work on all 1772:s (they are not
speced above 10MHz) but i hasnt heard about anybody whose
1772 failed to work... Anyway DONT DO THIS if you are
unexperienced in electronics a.s.o.
If it fails, go and buy a new 1772 for a couple of bucks
or get a pin compatible 1.44MB disk drive controller.
(IBM have some IC:s i think (Doesnt know the number) You
doesnt have to buy a AJAX chip).

steprate prg and formatter prg is avalible from
atari terminator.

Good luck with your project.

Patrice,

There are some new modules in the last version of CALAMUS SL.

One of them, call BRIDGE, allow you to export what you want in Postscript
Format, and you can do many other exports in raster or vector formats.

But if you want to print your CDK on a LaserJet 4 in 600 dpi, you can find
a specific driver for your Printer (contact for example SCAP in France).

Hopping you can do some tests on this extaordinary 600 dpi Printer...

4260. Re: WINX 2.1: how to change max

Newsgroup: comp.sys.atari.st
Date: 1993-09-19 11:51:00 UTC
From: Stefan_Damerau@sl.maus.de
Message-ID: <A51991@SL.maus.de>
Source record: 200936

In article 27alnu$4ff@cville-srv.wam.umd.edu 'Flip' wites:
C>to change the maximum window limit beyond 8 (the default).

Quite easy:

In WINX.INF (located in the AUTO-folder) Your favourite changes must be
defined. You can change GLOBAL and LOCAL switches.
The switch for more than eight windows is a GLOBAL one:

[WINX21.ENG On]
[G1] Increase number of available windows to 40 (instead of 8)
[WINX21.ENG Off

In WINX.INF You have to do this:

.GLOBAL = [...] 1+ [...]

THEN You will get more than eight windows ...

Bye
Stefan

I did several times, all you need is the RAM chips: 4x 414256-120 SOJ. (And don't drink too much coffee before soldering, you'll need FULL control of your hands and fingers - it's a very delicate soldering job...

Might be an early version of the Falcon's sound CPX. Later versions were called FSOUND.CPX.

Use the SOUND.CPX from your Language Disk - it certainly is the right one for your hardware.

4270. Problem with ZOO.TTP (second posting)

Newsgroup: comp.sys.atari.st
Date: 1993-09-19 17:14:53 UTC
From: swhatley@blkbox.COM
Message-ID: <CDM2Ku.B13@NeoSoft.com>
Source record: 200930

A couple of months ago I download ZOO21.TTP from a.a. Whenever I try
to unzoo a file, it bombs (2 bombs). Could the be a problem with
my setup which is as follows:

Mega 4 ST (TOS 1.2)
Megafile 20 (5M and 15M partitions)
50M ICD Fast Drive (15M and 35M BGM partions)
ICDBOOT 6.0.X

I do not think configuration is a problem because I copied ZOO21.TTP
and a small zoo-ed file to a blank floppy and rebooted my system from the
floppy with my hard drives off. It still bombed.

Any help will be appreciated. BTW, I tried downloading ZOO21.TTP from
other sources like wuarchive and ftp.ue.net with the same result.

Thanks,
Steven Whatley

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Has anyone ported the E_GEM 1.13 libraries from Turbo/Pure C to GNU C?
There seem to be some problems, even when using the headers from tccompat.zoo
available on a.a.u.e.

The main problem is in porting the assembler code in vars.s and rc_ob.s. GAS
doesn't use Motorola syntax and so far, I'm having some problems getting
GST2GNU to recognize object files created with DevPac ST 2.08...

>One would think that if the Jaguar makes money that Atari will reinvest
>most of the money in the Jaguar. (It'll maximize their return).

I agree. And what's more, think about this. Say Atari manages to
actually become a success at marketing video games with th Jaguar. What
do you think the likelyhoood is of them returning to the computer
market, where so far they've done a good imitation of a complete failure.
Knowing Atari's history of dropping product on the spur of the
moment, I would not be surprised at all if they abandonded completely
the computer market if the Jaguar was a success.
Of course, this is assuming that Atari can make a success of the
Jaguar. They've proved many times their ability to snatch defeat from
the jaws of victory. Just look at the lynx.

Just to make a clarification:

CoNnect2.20 is not a _complete_ distribution of CoNnect. It is
just the files that were updated between 2.10 and 2.20. You should
download _both_ 2.10i and 2.20i, then perform the tasks described above,
to get the current version of CoNnect in English.

[Author was Beat Meier]
[Posted on Mon, 20 Sep 1993 07:59:45 GMT]

Hello all

I've just installed Hackfax 1.00 from the nic.switch.ch which is
a mirror site of wuarchive.wustl.edu and I've a problem.
The SENDFAX.TTP works fine but if I want to start the FAXVIEW.PRG
the program starts and returns imeadeatly (with 4 bombs). I tried
to debug but then the debugger bombs.
The file FAXVIEW.SYS who is listet in the readme.txt isn't there instead
there is the file FAXVIEW.INI.

I've an 1040ST with 1M Ram and TOS 1.4.

How can help ?

Thanks a lot

Beat

4288. questions about MGR

Newsgroup: comp.sys.atari.st
Date: 1993-09-20 10:55:02 UTC
From: fvkampen@cs.vu.nl
Message-ID: <CDnFnr.AE2@cs.vu.nl>
Source record: 200851

I am trying to build a system with MGR, but I have a few questions:

- I downloaded VDImgr, but it was no improvement, although the docs sugested that it was. Which one should I use (I now use mgr.zoo from the MiNT distr. Kit)

- Are there any programs that make use of icons or any other graphical interphase?

- When MGR is started, keeps my Mega STe running at 16MHz with blitter on?

- Can you make a desktop like X-windows that, when you startup, automaticly some programs are started and icons displayed and so-on.

- Does anyone have a good comm-pack for mgr? I now use mgrterm, but I need (as a minimum) a vt52 emulation. But if you set TERM to VT52 the program does not understand taht it is running in mgr. (because the only way to check, is to check the TERM var)

- Why are more and elvis so buggy. More does not delete it's line saying how many bytes it has printed. So if there is an empty line in te text, the more status bar scrolls up.
The atari gives hard-returns so Elvis has all sorts of ^M in the text. And when I modify the text, the status line scrolls out of the window. Is there a modification to the TERMCAP wich solves this problem?

- Does anyone has some general hints and tips...

Thanx, if I get any responses I will post a summary to the net...

The program converting disks to imagefiles, the MSA program,
has an ugly interface, yells clumsy error messages, and
has a 2 to 3 bomb attitude whenever it feels like it.

I hate working with it, I hate floppydrives, I hate everything about MSA
and the author should be hung high and married to a donkey;
in either order.

I'm sure he ment well,
but there's no arguing with boiling blood.

Glad to bother an audience of potentially 20 million people with this,
on to the next article.

4290. Problems with compiling MiNT 1.08

Newsgroup: comp.sys.atari.st
Date: 1993-09-20 12:17:42 UTC
From: Jan_Willekens@p12.f202.n281.z2.fidonet
Message-ID: <2c9d9f7a@p12.f202.n281.z2.fidonet>
Source record: 200863

Hi!

Yesterday I decided to upgrade my GNU setup from GCC 2.3.3 to 2.4.5 and
MiNTLib pl34 to pl35. Compiling the MiNTLibs went (after a lot of troube)
fine, but then I decided to recompile MiNT 1.08 with this new setup. And
then the real trouble began:

I encountered some errors which I hadn't seen before. (I managed to compile
MiNT 0.9something up through 1.09 without any difficulty using my old
setup) All went fine up to this point:

```
gcc -O -o asmtrans.ttp asmtab.o trutil.o trans.o \
-llio

trutil.o: Undefined symbol -yyerror referenced from text
trutil.o: Undefined symbol -yyerror referenced from text
trutil.o: Undefined symbol -yyerror referenced from text
trutil.o: Undefined symbol -yyerror referenced from text
trutil.p: Undefined symbol -yylval referenced from text
trutil.p: Undefined symbol -yylval referenced from text
trutil.p: Undefined symbol -yylval referenced from text
trutil.p: Undefined symbol -yylval referenced from text
trutil.p: Undefined symbol -yylval referenced from text
trutil.p: Undefined symbol -yylval referenced from text
main.o: Indefined symbol -main referenced from text
```

And that was that. I switched back from GNU 2.4.5 to 2.3.3 and from
MiNTLibs pl35 to 34, but this didn't help. I used Gnumake 3.63 and GCC-LD
pl33 and pl36.

Anyone any ideas?

I thought so myself, but it didn't work. But after reading your message, I
tried renaming the .gz file into .z. This worked. So gzip -d
wilson_o.gz didn't work, but gzip -d wilson_o.z did. Strange...

Source record: 200852

Hello,

I got the shareware version of GEMAR, that steamer software for SCSI tapes and not being fluent in german, was looking for the ENGLISH\ subdirectory mentioned in the readme file. I could not find it anywhere. Does anyone know of a ftp site that has GEMAR with the ENGLISH\ subdir included? Also does the author of GEMAR read news? if so can he mail me as I would like to register for this product, but these overseas transactions are always quite a hassle.

cheers,
scott.

PS. I am using a 1.2 Gig 4mm DAT drive on the SCSI buss of a TT, if someone knows of some english software that will read/write such a device connected to the TT SCSI bus then please let me know.

cheers,

>Civilization runs fine apart from the buggy colours,but it is relatively easy
>to get used to them. I have had no luck with Backward or Magi in solving this
>one problem.

It has been quite a while since I looked into this, but the information below
is at least almost correct.

The colour problem should be easy to fix with a program such as Backward, since
it's a feature of the Vsetscreen and Blitmode (or something like that) calls.
Civilization sets the colours before it sets the screen mode and even later it
turns on (or was it off?) the blitter.
On the Falcon those calls seem to copy the palette from the Falcon specific
256 entry one to the ST compatible one. This causes the colours to reset to
the ones used on the desktop (or perhaps it was some Falcon defaults).

What I did was to simply disable those calls and start the program from ST low!

Another problem was that Microprose had mixed up GEMDOS and BIOS keyboard input
calls, which caused the program to repeatedly detect a pressed '\0'.

Finally, I disabled the sound.

After these fixes Civilization ran from harddisk with the correct colours,
even without using Backward.

Old gzip versions (<=1.07 something) use the extension .z and these
version don't recognize the .gz extension. If you rename the file .z
extension or feed the input file via stdin the old gzip should be able
to uncompress it. Anyway the latest gzip is available from
garbo.uwasa.fi: unix/arcers/gzip124.tar.Z.

```
SD>In WINX.INF You have to do this:
SD>
SD>.GLOBAL = [...] 1+ [...]
SD>
SD>THEN You will get more than eight windows ...
```

False!

A short extract of my WINX.INF:

```
# WINX.INF
[stuff deleted]
# Globale Schalter
# ================

# Beim Start des GEM werden zunaechst alle globalen Schalter einge-
# schaltet. Dann werden die unter .GLOBAL angegeben Schalter veraendert.
# Syntax: '.GLOBAL' '=' <SCHALTERLISTE>.
```

This means:

```
Global switches
===============

When starting GEM, all global switches are switched on. Then the switches of
.GLOBAL are changed.

Therefore he has to check, wether there is a .GLOBAL = 1- statemant in his
WINX.INF. If so, he has to remove the 1-.
```

There was great fun and frolic in the article from
<H.eg.2a4g31QTeA_@semprini.tdkcs.waterloo.on.ca>
cherborth@semprini.tdkcs.waterloo.on.ca in which is written:
>If Windows did pre-emptive multitasking, single applications wouldn't be
>able to hog the system so easily. Also, when you install Windows, it
>doesn't multitask DOS programs _at_all_, you have to change the default
>settings to get that to work.

I believe he's agreeing with my comment that Microsoft Windows
doesn't perform pre-emptive multitasking. Or maybe not.

>> True, there is a standard operating system that ships with *every*
>> Atari. It's also true that you can get alternate operating systems
>> (OS-9 springs to mind) that will run on the Atari. I see discussions
>> of alternate file systems on other threads in this and other Atari
>> groups, so I can assume there are a few more....
>
>The alternate filesystem thread has almost nothing to do with operating
>systems; it's about MiNT (which isn't a complete OS, since it relies on
>the underlying TOS to get its work done).

I believe he's agreeing with me again, both on the subject of
alternate file systems (minix is the topic of discussion, I
believe) and alternate operating systems such as OS-9. Is
there some technical wizard that can provide an authoritative
posting on alternate file systems and alternate operating
systems available on the Atari?

And his comment about MiNT seems correct (from what I've seen
of MiNT, anyway): it's a shell over the operating system,
in much the same way that Windows is a shell over MS-DOS.

>> >Atari has been "rebuilding" its dealer network for the past seven years.
>>
>> Persistant, aren't they?
>
>More like 'stupid', IMHO. The number of dealers just keeps shrinking.
>You really can't call music shops 'dealers', since probably 99% of them
>have no clue about computers, they just know that the Atari machines
>have MIDI ports already, and a few good software packages.

Having quizzed the sales people at the local Computer City and CompUSA
regarding their product on display, I can state without fear of rebuttal
that the music store dealers adhere to the same high standards of
knowledge and performance as the computer merchants. :-)

[My Comments Relating To Atari's Marketing Effort Deleted]
>Hahahahahaha....
>Hahahahahaha...

>Atari's _needs_ to be held up by its dealers or it would've died
>completely in the past four years.

If you're saying that the dealers need to sell the product,
you're right! (We seem to be agreeing a lot these days!)

>But still no hardware for them to sell, and no one to sell it to because
>the Falcon is not competitive with _anything_ else on the market.

Not in massive quantities ... yet ... and Atari is being cautious
because the overall market for computers is depressed, for now.
Apple's had to slash prices, IBM's had to lay off workers and
experienced an embarrasing decline in stock price from $120/share
to $40/share, and Commodore ... well they're still in there trying!
This is not the sort of market that encourages a "giant leap forward".

Not competitive? It takes a '486 @ 66 MHz MS-DOS machine to keep up
with a 68030 @ 16 MHz Falcon, and it's the *Falcon* that's not
competitive???? <incredulous look> One needs to spend a thousand
dollars _more_ just to get the same performance as a Falcon, yet
the *other* machine is 'competitive'? <even more incredulous look>
And knowing that the rate of change will make the 'other' machine
obsolete in about three years is more competitive than a machine that
remained usable and productive for eight years? <thoroughly
incredulous look>

I don't think so. The MS-DOS machines appear to be the ones that
are 'not competitive'.

>> >The Jaguar was brought up because Atari has virtually abandoned the Falcon
>> >already, putting (according to Bob Brodie, just to satisfy Warwick's
>> >curiosity) all its resources ($35 million, down from the $50 million
>> >they said they had to launch the Falcon) toward launching the Jaguar.
>>
>> It that were true, they wouldn't have been at the San Diego Computer
>> Fair, actively demonstrating only the Falcon!
>
>Yes it would, because they _can't_ demo the Jaguar yet, so the Falcon is
>their only potential source of income right now. They certainly haven't
>been demoing a more powerful Falcon anywhere, now have they?

You're right, they _can't_ demo the Jaguar yet. But if Atari was
using "all its resources ($35 million, down from the $50 million they
said they had to launch the Falcon) toward launching the Jaguar",
then they would *not* have been at the show at all. My point: Atari
is still actively marketing the Falcon.

In another response, I've copied a question posed to Bob Brodie of
Atari and his answer relating to future Falcons. In short, Bob says
there will be more of them coming down the road.

Message-ID: <1993Sep20.160908.28746@dfv.rwth-aachen.de>
Source record: 200861

Dear Netter's,
I was wondering if there is sombody out there, who ever thought about
using atari peripherie (Monitor, Keyboard, Mouse) in combination with
a mac computer.
There a still many people using atati maschines (under the mac-emulator
spectre), but since computers are getting faster and faster some
of them might want to upgrade there maschine to a real mac, without
spending much money.
I think, there must at least be a way to take the Atari Monitor and connect it
to the MAC.
Is it possible to use the Atari keyboard at the ADB-bus?? (and the mouse?)
Maybe someone has experiense.
Thanks in advance.

TOS 1.4 (which works quite nicely with MultiTOS and/or MiNT) has been available for the ST computer line for, oh, at least 4 years now. Your 'quality software' comment is out of order. It is on the same level as a Macintosh owner complaining that a program doesn't run under system 4.1, or that a PC program no longer runs under DOS 2.2.

I know that Atari-bashing has become the 'in thing', but if you insist on using an outdated version of TOS, you'll have to realize that SOME programs aren't going to work correctly. If you own, or wish to own, a hard drive, you had better seriously consider getting a more recent version of TOS than 1.2.

4305. Serial Mice for ST/TT/Falcon

Newsgroup: comp.sys.atari.st
Date: 1993-09-20 16:26:00 UTC
From: cybercube.research@canrem.com
Message-ID: <60.37170.4514.0N184153@canrem.com>
Source record: 200869

Hi Andrew,

-> Has anyone had any success with sticking a serial mouse or PS/2 mouse
-> onto a Falcon. I need a trackball and these are not like the Atari
-> standard mice are they? I suppose I'll need a driver too!
->
-> Any help with mice, connectors, and driver software would be
-> greatly appreciated.

We wrote a program called CyReL Serial Mouse Manager for the
ST/TT/Falcon computers.

It let's you use serial IBM PC/AT mice compatible with the Microsoft or
PC Systems mouse standard.

Additionally you can use the Summagraphics tablets as well.

The whole thing works without any adapters or soldering. You just need
to install a small file in the AUTO folder and a tiny *.ACC program.

You can find a demo version of this program on many systems or simply
leave me a note.
The full version costs just US $13 or Cdn $15. S&H for international
customers is US$2.

If you need more infos, please send e-mail to:
cybercube.research@canrem.com

Best Regards,

Ralf.

Actually, you can use the font package for Word Perfect 6.0 for DOS under SpeedoGDOS. They were selling it at a local EggHead for about $20 a while back, and one of our user group members bought the package for his TT -- the fonts work quite nicely under Atari's SpeedoGDOS. If it works one way (i.e. DOS --> Atari SpeedoGDOS), it might work the other way as well.

Note that this was the font package for the DOS version of Word Perfect 6.0. The Windows version doesn't use Bitstream fonts (at least as far as I can tell...)

>works with Atari ST's. So you guys are my last resort. I live in the Columbus OH
>area. A used drive would be fine. I'm willing to travell to Pitt, Cleveland,
>Cinci or Indianapolis to find one.

I just got a TEAK internal floppy for my 1040ST (the old one died) by
mail order from TOAD computer for $79.
You have to cut out a bit on the plastic base, because the eject button
is in a different place (and the disk slot is lower down).
Also the orientation is different, and it is very tough to make the
ribbon cable flip over to reach the drive. (Maybe ask if they'll include
a longer ribbon cable) Anyway I eventually got it to reach alright.
(No idea whether you can find the same drive cheaper elsewhere...
These days 1.44M drives are cheaper than 720K, but I decided against trying
to upgrade to that... TOAD also sells hard-drives, or you might
try ICD (where I got my host adaptor).

4308. MegaST for sale

Newsgroup: comp.sys.atari.st
Date: 1993-09-20 17:04:44 UTC
From: hsp4@namaste.cc.columbia.edu
Message-ID: <27knrc$t2d@apakabar.cc.columbia.edu>
Source record: 200862

What I'm selling is a Mega ST2, purchased in 12/88. Let me give you an idea of what's going on with mine:

- Still has the Original TOS 1.02
- Atari Mouse replaced by a Golden Image mouse
- Original CPU replaced by a JRI JATO 16MHz accelerator in a socket. This accelerator clocks at 186% of raw ST speed on pure computation, and it yields a true speed increase of about 20% (it, unlike the Adspeed, isn't cached, to the best of my knowledge). It is hardware switchable (by a toggle on the side of the case) and it has a CPU busy light.
- Original RF shielding removed (when the JATO was plugged in).
- Space on motherboard for an additional 2MB of RAM (supposedly, some MEGA ST2's didn't have the space).
- Original FD replaced in 6/92 with a new Atari drive. It has been VERY lightly used--(I do everything off of my harddisk, or off of a RAMdisk, when possible).
- You may want to get a new keyboard cable for it (some of the wires are a little raw, but it still works okay).
- I still have original box and packaging (although I can't find the FD protector or the Language disk, but I'll try).

I'm asking $350+shipping, but I'm flexible, as I really need some $$$.

I don't believe there is a way to connect a 4 to 8 year old
fixed frequency 12 in monochrome monitor to a new (colour?) mac,
it really is cheaper to by a new 14 in *grayscale* monitor

|> Is it possible to use the Atari keyboard at the ADB-bus?? (and the mouse?)

This would be very difficult and my question is, why? I haven't seen
a mac which came without keyboard and mouse.

|> Maybe someone has experiense.
There still is one thing you can use:

The Operating System!

There is a MACMiNT available which alows you to use TOS (not GEM)
PRGs on a MacIntosh.

Here is a quote of a mail i got in response to an
comp.os.linux.development article

Return-Path: <menes@statistik.tu-muenchen.de>
From: "Rainer Menes" <menes@statistik.tu-muenchen.de>

Ja MacMiNT kann fast alle TOS und alle MiNT Programme laufen lassen.

MACMiNT is able to run almost every TOS and MiNT programm.

Bei GEM siehts sehr schlecht aus. Ich habe keine Idee wie man das machen soll.

But GEM seems to be really hard \dots

Wenn ich mich recht errinnere war die Basis die LINE-A Routinen und genau
auf diesem Trap liegen beim Mac die Toolbox Routinen. Ich glaube das wuerde
sehr schwer. Aber ich haette auch nicht geglaubt das einer MacMiNT und
ein fast vollstaendiges TOS auf dem Mac zu laufen gebracht hat wenn ich es

nicht selbst benutzen wuerde. Abwarten bis Atari Freaks auf Mac wechseln
und so ein Ding schreiben.

Habe eigentlich das wesentlich in meinem Artikel in maus...mint gesagt.

I've explained everything in maus...mint (A german mailbox-network)

MacMiNT geht auf jedem Mac, aber es macht erst richtig Spass auf einem
68040. Also ein Centris ist nicht schlecht, ob wohl ich mit dem 660 AV

... i really enjoy it on an 68040 ...

zur Zeiten als den besten Rechner von Apple zu einem guten Preis ansehe.
Der Centris 610 hat halt keine FPU was fuer einige Programme sehr schade
ist, aber mit MacMiNT nicht zu tun hat.

Also MacMiNT gibts auf

MACMiNT is available at:

suniams1.statistik.tu-muenchen.de(131.159.64.1):/pub/mac/MacMiNT.

Ich hoffe es hilft dir weiter, bis demnaechst auf dieser Welle,

What does TOS 1.4 do for you (as far has hard-drives go) that 1.2 does not?
I have a hard-drive and am running TOS 1.2 with no problems. Are there some
bug fixes in TOS 1.4 that would make it worthwhile to upgrade, or are the
enhancements things that most users could live without???

Just wanted to post a public 'Thank You' to John King Tarpinian, the H.A.C.K.S. group, and all the myriad others who worked hard to make the Glendale '93 Atari Fair a success. Although the numbers of show attendees appeared to be down from past years (as expected), those that attended came to buy. And buy they did from a number of dealers and vendors who were offering some truly amazing specials on both hardware and software. A large number of new Falcons went out the door over the weekend, as well.

Although the Jaguar was not demonstrated publicly, a few developers did manage to get a sneak peak at the unit and some beta games for it on Saturday night. Can you say "Wowsa?" I knew you could. :)

Thanks also to those who stopped by the Fair Dinkum Tech booth. It's always great to associate a face with an email address you've known for a long time.

Cheers,

People in our institute have tried to get info on this issue,
too, as far as I know they found no way of using Atari equipment
with macs. Apple is pretty careful to keep their stuff
incompatible with other computers.
If you want more speed, though, I've been told it's possible to
make Spectre GCR 3.0 work with a TT. The mac emulator runs
approx. 4 times faster, plus you have a very good computer on its
own, e.g. if you want to do DTP or someting one day...

4316. TT rom dump, please?

Newsgroup: comp.sys.atari.st
Date: 1993-09-20 19:12:09 UTC
From: karlo@ifi.uio.no
Message-ID: <1993Sep20.191209.3994@ifi.uio.no>
Source record: 200873

Someone is probably going to flame me for this, but what's life without
a little heat?

I need a rom image dump of a TT - 3.06 german, preferably (I'm into S&M :-).
My roms have somehow gotten corrupted, so things aren't too hot right now.
I managed to boot a patched TOS 2.06 off disk, so I got things running
pretty smoothly (well, as smootly as 2.06 would run on a TT), but it's
not exactly a desirable setup.

Seeing as Atari Corp's nonexistant in Norway these days, I thought I might as
well give c.s.a.st.tech a shot.

So, if anyone could be helping in any way, drop me a mail? Please?

/Karl Anders Oygard - karlo@ifi.uio.no

4317. Ghostscript 2.61 beta version available.

Newsgroup: comp.sys.atari.st
Date: 1993-09-20 19:21:21 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <27kvrh$92n@geraldo.cc.utexas.edu>
Source record: 200879
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

A beta test version of Ghostscript 2.61 is now available for anonymous ftp from

lifshitz.ph.utexas.edu
pub/atari/ghostscript/beta/gs261bt1.zoo.

The Atari interface has changed a good deal, and there are likely to be a few bugs, so please don't upload this file to any other sites. If you can't access lifshitz for some reason and you really need to test something, I can email a copy to you.

Ideally, a tester should already be familiar enough with Atari GS to set it up without much help. The beta archive on lifshitz has MINIMAL documentation and support files.

I am particularly interested in having the following things tested:

1.) The new console window (text i/o) needs a thorough thrashing.

2.) 8 and 16 bit color need to be tested. I would like to hear whether they work and on what hardware.

Atari-specific source code is included, so if you encounter something that doesn't work, you may be able to find the cause.

Comments can be sent to

Tim Gallivan

It depends whether the fonts are encrypted with retail font encoding or
with OEM coding. All Speedo engines can read retail fonts, but only
their own OEM coded fonts.

If the Speedo fonts shipped as part of Speedo are OEM coded WP6 wouldn't
touch them, if they were retail coded then no problem.

4M is enough. It just leave much space for anything else. GNU C++ and
a shell, plus small AUTO and ACC programs, and MiNT. No room left
for a RAMdisk.

Without an FPU, raytracing is orders of magnitude slower, and really
not worth the waiting... except when you can do it in the background,
like under MiNT!

Take a gander at what Chris did spout on 17 Sep 93
....

CH> I really don't think you can blame the hugeness of WindozeNT on
OO
CH> programming; it's the 999 million kludges required to run
crummy
CH> hacked programs and run on the kludged ISA architechture.
Supposedly
CH> it's so huge because it's portable; I've never heard of a unix
kernel
CH> that _requires_ 12M of RAM just to boot.
Ok, ok I give in ;-)
I am a Unix SA with no C based programming so needlessly blamed the OO
programming (though certain problems which occur with Windows seem to be down
to poor OO programming ie cannot perform a certain action with just a Cancel
button which seems to endlessly
loop!)

CH> For all of my complaints, I'd buy a Falcon040 real quick... I
like
Same here! Come on Atari get up off your rears!!!!! (fat
chance!!!)

CH> OS/2 is 2.3.3; no templates! :-(The more I look at things,
the
CH> more attractive a NeXT (a real, black one, not NeXTstep for Intel)
or
CH> Sun is. Then again, I'm always assuming that the Falcon040
wouldn't
Nice choice (would be the same here as I work with PC's, Mac's and Mips based
Unix boxes and only like the Unix boxes (perverted or what ;-)

CH> have the same bozo design problems the TT030 and Falcon030 have (the
CH> TT's essentially a 16Mhz machine with a 33Mhz CPU grafted on; the
CH> Falcon's barely powerful enough to drive its own graphics modes, and
CH> crippled by a 16-bit bus).
Yep some nice ideas, shame about much of the implementation.
But at the moment I am drooling over the T36 board which is just becoming
available for STFM owners (I may be selling my ADSpeed if I get one ;-)

Wow, did you manage to erase a disk by clicking the wrong button or something?
Anyway, check out MSA 2.3+. It is much better than the original MSA program,
which I suspect you are referring to.

4333. Cheap monitors?

Newsgroup: comp.sys.atari.st
Date: 1993-09-21 04:27:15 UTC
From: dakawie@netcom.com
Message-ID: <dakawieCDosDG.BEL@netcom.com>
Source record: 200897

My SM124 monitor had been giving me a violently flickering screen upon startup so I attempted to fix it by replacing a capacitor which worked for about 30 minutes before I smelled burning and my monitor died.

Does anyone know of a cheap substitute for the Atari monochrome monitor? I have a 1040STF which requires a "video key" to work with a t.v. but these damn video keys are nowhere to be found.

Is there such a thing as a cheap multisync that will work with the ST?

I eagerly await any info on this,
Thanks, David (dakawie@netcom.com)

MTOS works fine with TOS 1.02, BUT the problem I have found is with the
installer program. My friend has TOS 1.02, and he could not get the installer
to work with the ICD hard disc driver installed. Needless to say, installing
it without an HD wouldn't work well at all.

Luckily, our hardware configs were similar enough for me to copy my
configuration files (installed under 1.04) to his. MTOS works fine on his
machine.

I would like to know this also. I may not have a nice 1.2GB DAT
(I wish!), but eventually I would like to get a SCSI tape backup unit, and
since I don't have any ACSI host adapters for my TT, I will have to use
the SCSI port, which I prefer anyway. Unfortunately, every tape backup
software that I have seen so far (*) does not support the TT's SCSI port.

(*) While I was at the Glendale Atari Fair, Oregon Research was
showing a preview of DiamondBackIII which, among other neat features,
supports tape backup to all drives on the TT! Unfortunately it won't be
released for another month or so. It has a nice, Fastback-like interface
for doing backup, and supports all SCSI-I supporting tape devices on both
ACSI and SCSI ports. It will support both unix tar (and compress) as well
as diamond's proprietary format.

That said, if I can get workable PD software for free or close to
it, I would probably pick it over DBIII. :)

Obsillyquestion: If Kempo Karate is the art of fighting with an empty

September 26, 1993

M a s t e r B r o w s e 3 . 1
""""""""""""""""""""""""""""""""

Copyright 1993, Michel Forget
Electric Storm Software

There is a new version of MasterBrowse available!

The file (mb31_bin.zoo) has been sent to atari.archive.umich.edu
(and will be available as soon as the archive maintainers process it).
In addition, the file will also be uploaded to ftp.cs.tu-berlin.de and
ftp.tu-clausthal.de over the next few days. It will also be sent to
comp.binaries.atari.st for distribution.

For those who have never used MasterBrowse before, a detailed description
of the program will follow this list of new features and bug fixes:

[NOTE: The new features and bug fixes for this version are listed BEFORE
the new features and bug fixes for the previous version.]

~ ~

MasterBrowse 3.1 (September 26, 1993)

o MasterBrowse now replaces its filename under the desk menu (if you
have MultiTOS) with the word "MasterBrowse".

o MasterBrowse now supports the AP_TERM message, so it will behave more
cleanly during a resolution change under MultiTOS.

o MasterBrowse now uses 3D buttons under MultiTOS.

o A bug was fixed that caused MasterBrowse not to highlight the line on
which a string was found (unless the line was within a marked block).

o A bug was fixed that caused the edit-cursor not to be on the first
edit field of the dialog box with the old-style dialog boxes.

o When you are inside a non-modal dialog box (a dialog box that is
inside a window), you can now press ALT-1 -> ALT-0 to edit the
first ten editable text fields. You can also press the UNDO key to
exit the dialog box as if you had selected "Cancel" or "Abort".

o When you are inside a non-modal alert box, you can now press ALT-1 ->
ALT-3 to select the first, second, or third button of the alert box.

o MasterBrowse no longer uses the AES version number as the key to decide whether or not to install its name under the "Desk" menu. It now uses the number of concurrent processes that the AES can maintain.

o If you have a registered version of MasterBrowse, the exit button of the "MasterBrowse" dialog now says "Thanks!" instead of "Donations!".

o MasterBrowse now allows you to change the keyboard definitions, so you can change the keyboard shortcuts if you do not like the defaults.

o A bug was fixed (yet again) in the "Jump -> Page" function. The screen would not be positioned correctly if you tried to jump to the last page of a document.

o MasterBrowse can now use the special effects of your printer to make your documents look better on paper!

o A bug was fixed in the dialog box handler. The UNDO key was not being recognized. (The HELP key took its place.) This is now fixed.

MasterBrowse 2.8a (September 8, 1993)

o A problem with the variable movement base was fixed; if the new position would be before the start of the document, or after the end of the document, then only the scroll bar would be moved.

o The "Escape" key is no longer used by MasterBrowse.

o The "Save Positions" option now operates slightly differently. If it is highlighted, MasterBrowse will save the positions of the first seven windows. In addition, it will open the first seven windows in the saved positions. If it is NOT HIGHLIGHTED, MasterBrowse will not use the saved window positions (or save them if they change). When a document is opened, the window will be sized to fit the document. The title of this option is now "Save/Use Positions".

o MasterBrowse can now use "ClrHome" to move to the top of the current document, and "Shift + ClrHome" to move to the bottom of the current document. You can, of course, still use the other methods.

o MasterBrowse now supports colour! You can set the colour of the text and the colour of the window backgrounds. The colours that are available are the first sixteen colours in the system pallette.

o A bug was fixed; if a large document was being loaded, the size of the window would not be correct.

o A redraw bug was fixed; the portion of the window that needed to be cleared for a single line movement was being cleared twice (once in white and once in the background colour).

o The "Expand Block" function has been improved. It now shows the name of the file the block was extracted from, and the number of lines in the block. (Previously, it showed the information associated with the parent of the block, and nothing about the block itself.)

o A keyboard bug was fixed; "Window Information" and "Decompression Options" had the same keyboard shortcut!

o MasterBrowse can now be told to write an entire document to disk. As with all of the other output functions, you can decide how (or if) MasterBrowse will format the document.

o "Partial Line Mode" (an option that controls how the block markers are displayed) has been removed. The ammount of time it took to check for the special case was slowing the redraw loop down. In addition, the redraw loop has been optimized for more speed.

o There is now a new block display option. "Bold Text" will cause MasterBrowse to display the block markers as usual (with inverse or hatch) but the text on marked lines will also be drawn in bold.

o A bug was fixed with scrolling to the right. When the keyboard was being used to do the scrolling (as opposed to the mouse) the last column of the text could not be displayed. This has been fixed.

o The alert boxes now have a red icon, instead of a green icon.

o The code that sets the window title bar was cleaned up, which should solve some conflicts (which were apprently random) with other programs.

MasterBrowse 2.8 (August 30, 1993)

o A text formatting problem was fixed; "Print Block", "Clip Block", and "Write Block" all appeared one column to the right of where they should have appeared.

o The "Jump -> Page" feature has been fixed again; it now considers a page to be the number of lines on a printer page (you can set this in the "General Options" dialog box).

o There is a new command line option; "-gemini" prevents Gemini from conflicting with MasterBrowse (system crash). To make the process of adding "-gemini" to the command line transparent to the user, a .MUP script has been placed in this archive. Simply install the .MUP script as an application instead of MBROWSE.PRG (and be sure to edit the filename in the .MUP script so that it knows where to find MBROWSE.PRG). Next, set the following two Gemini application controls; "it is a GEM application" (this will prevent Gemini from playing games with the mouse pointer) and "close all windows on startup" (this will prevent Gemini from opening the Console window to execute the script). When installed properly, this entire process is transparent to the user.

o There is now a second popup window menu; if you double-click on any line inside a MasterBrowse window, a subset of the "Position" menu will appear on the screen.

o A bug was fixed with right scrolling; with a document that was not as wide as the window, you could scroll to the right anyway.

o A bug was fixed with left and right scrolling with the window arrows; the bell would not sound when the user tried to move beyond the boundaries of the document.

o A bug was fixed in the keyboard routines; pressing ALT-L had no effect, when it should have been calling the "Jump -> Line" function.

o A bug was fixed in the "Find" dialog box; selecting "Cancel" now exits without changing the search strings, or the status of the searching options.

o MasterBrowse is now completely resolution independant; it can redraw the screen using RASTER COPIES (very fast and smooth) in any resolution now.

o MasterBrowse can now use GDOS monospaced fonts in text windows. Changes made to the GDOS settings will not take effect until the next time you enter MasterBrowse, or until all windows have been closed.

o MasterBrowse no longer draws new text windows twice the first time they are displayed.

o The "Set Options" dialog box has been altered (along with the dialog boxes that can be accessed through it). Each of the sub-dialogs now exists as a function that can be selected from the main menu. This makes it easier to change your options.

o A bug was fixed in the line selection mechanism; when the user clicked (or double-clicked) on a line, the highlighting obliterated the text on the line. This only happened if "inverse" was selected as the method for drawing block marks.

o A scrolling bug was fixed; in MasterBrowse 2.6b you could scroll past the end of the file, which would cause a system crash. This is now fixed.

~ ~

Everyone who owns a computer has, at one time or another, needed to view the contents of a text file. The text file viewer supplied with Atari computers will allow you to do this, but it is lacking in many respects.

MasterBrowse is a replacement text file viewer for any Atari computer, in any resolution with a size greater than or equal to 640 X 200. It offers many features that the Atari text file viewer does not:

* MasterBrowse works with MultiTOS, and should work with other multitasking operating systems for the Atari, such as MultiGEM, Mag!X, and Geneva.

* MasterBrowse has an extremely fast GEM user interface, which makes use of raster copy screen updates, GDOS fonts, pull down menus, progress displays, windows, optional non-modal dialog boxes (and alert

boxes), colour, and more. MasterBrowse also provides keyboard equivalents for every single function.

* If you do not like the default keyboard shortcuts for menu entries, MasterBrowse will allow you to change them!

* MasterBrowse allows you to have a virtually unlimited number of documents open at the same time, restricted only by the number of free window handles and the amount of memory available.

* MasterBrowse can use the command line (of course) to open documents (or open a document batch). The ARGV, xArg, and standard command line formats are supported.

* MasterBrowse allows you to use all of your familiar movement keys. You can use the arrow keys, the application keypad, or the space bar and the return key.

* MasterBrowse allows you to move in any direction inside a document, as you would expect. What you might not expect is that you can tell MasterBrowse how far it should move when the movement keys are pressed. How about moving two lines down instead of one? or perhaps three lines suits you better?

Do you still want more? Keep reading.

-You can jump to a specific line, a specific page, the start of a block, the end of a block, or any of ten personal "bookmarks" that MasterBrowse supplies for each window.

* MasterBrowse also offers you the ability to search for up to three strings at the same time inside a document (case sensitive or case insensitive), starting at the top of the document or the current position. If a search is performed starting at the current position within the document, MasterBrowse can be told to search in forward mode or reverse mode. After the string is found, another command may be used to find the next (or previous) occurrence of the string. When strings are found, they are placed in the centre of the screen and highlighted.

* MasterBrowse also has block functions. You can mark a block off, and then save it to disk, print it, or write it to the clipboard. You can decide how the block is marked on the screen. MasterBrowse can also be told to remove the block markers after a block operation is completed. Blocks are marked using the -MOUSE-. More? A block can even be extracted from a larger document and placed inside a MasterBrowse window! You can even write a block to disk or to the clipboard (with all of the same formatting options available).

* MasterBrowse will also allow you to write an entire document to the disk (with the formatting options available when printing or writing a block).

* MasterBrowse is a master printer. It can print a document (or a block) with page headings, page numbers, line numbers, a description of the file or block, or a combination of the four. It can even print an identification string for those people who share a printer between more than one computer. You can also save a block to disk (or the clipboard), with all of the same options available. If your printer can do special effects, you can configure MasterBrowse to use them (which really makes your documents look sharp on paper)!

* MasterBrowse gives you complete control over your windows. You can cycle through them, change their titles, shrink them, close one, close them all, or get information about them all from the keyboard (or the mouse).

* MasterBrowse saves the positions of the first seven windows, so you have complete control over where your documents appear and how your screen looks.

* MasterBrowse allows you to load and save different configuration files.

* MasterBrowse allows you to load and save bookmark lists.

* MasterBrowse displays (optional) progress maps, just like the GEM Desktop.

* Every window has a set of block markers and a set of ten bookmarks to itself.

* MasterBrowse supports batch files! If you use a certain group of documents often, just load them up and tell MasterBrowse to create a batch file. One double-click on the batch file, and they will all be loaded again.

* MasterBrowse also has support for the clipboard! A block can be written to the clipboard (with or without formatting) or the clipboard can be read into a MasterBrowse window.

* MasterBrowse allows you to interface (transparently) with as many as four external archivers, so that you can save space by storing your files in a compressed format.

* MasterBrowse allows you to move through a document (by lines or pages) using a special Quick Scroll Mode. It uses the shift, control, and alternate keys so that the scrolling speed is not limited by the key repeat speed.

* MasterBrowse allows you to remove the vertical window scroll bar, the horizontal window scroll bar, or both scroll bars. In addition, each MasterBrowse window can have different scroll bar settings.

The features listed above barely scratch the surface of MasterBrowse!

Hello,

I've just uploaded lps v1.21 ! It supports the following sound-formats:
AU, WAV, AVR, IFF/8SVX, VOC and all kind of raw-sounds. Also new
is a option to change the volume of the sound. Try it!
You can find it at:

ftp.uni-erlangen.de in /pub/atari/sound/player/samples/lps121.lzh
atari.archive.umich.edu in /atari/New or later in /atari/Sound/Players

Bye Uwe.

>fonts work quite nicely under Atari's SpeedoGDOS. If it works one way (i.e.
>DOS --> Atari SpeedoGDOS), it might work the other way as well.
>

I just tried some Speedo fonts from WordPerfect Presentation (DOS)
which _mostly_ worked. Swiss 721 Thin and Swiss 721 Thin Italic didn't
work at all, but Century and Charter work Ok.

This suggests to me that the encryption for SpeedoGDOS is the same as
for WordPerfect/PCs.

Does anyone know exactly what the .TDF files are? More to the point,
what should I fill the fields with when I create a new TDF? (The files
are structured text, by the way)

Thanks in advance!

|> incredulous look>
Even a 25Mhz 486sx will show a Falcon a clean pair of heels.
To compare, I looked at PC prices recently. 486sx25, 170Mb HD, 4Mb RAM, Windows accelerator(1mb), mouse,keyboard,multisession CDROM. GBP740. falcon, 4MB 65Mb HD, keyboard, mouse GBP950. No contest.

Don't get me wrong though, I'm very pleased with my Falcon and it does pretty much all I want plus run nearly all my existing ST software collected over the last 6 years. It sure ain't value for money though!

Not really. Gzip changed the file extension around version 1.2 from .z
to .gz. Get a more recent version of Gzip.

You should get the latest version of gzip (1.2.4). They have changed
the suffix from .z to .gz due to conflicts with pack which uses the
same suffix. Newer versions of gzip both recognize .z and .gz as valid
suffixes.

After upgrading to TOS 1.4, I couldn't do without it!

FAT searching is *much, much* faster in TOS 1.4 -- this speeds up your hard
disk immensely. Disk caching is also properly implememted. And, as long as
you have the POOLFIX patch installed, you are far, far less likely to run
into the 40 folder problem.

I recommend you upgrade -- it really is worth it. You might like to look at
the TOS 2.06 upgrade boards you can now get. They give you a better Desktop
and you don't need the POOLFIX patch any more.

I'd guess you're using a older version of gzip. They changed the extension
from .z to .gz somewhen around version 1.0. If this is so, your gunzip
just didn't know that to do with the .gz extension.

Hi there,

Is there anybody out there, who can help me with the next problem?

I want to make a software-reset on my Atari 1040st_E_. So I've taken
my Deutsche Profi-Buch which tells me to jump to the adress in
location $42A provided that the adress $426 contains the value of PI.

This procedure will work on any Atari computer, but mine. Is there
a difference between the 1040st and the 1040stE in this respect?

Please can you answer me in private-netmail, cause I can't read
the Newsgroups.

Thanx in advance!

... (rest of the article deleted) ...

Oh come on, although I am an ATARI TT owner, I never would say that
a 486/66 machine is that bad. OK, DOS is an awful operating system
and the standard ISA bus system runs at only about 8 MHz.

But don't forget that you have at least one reasonable alternative to
DOS, namely Unix/Linux, which isn't available at all for TOS machines
(ok, a poor implementation of Unix may be available for developers).
And the ISA bus also isn't today's standard any more. More and more
PCs are sold with the much more faster Local Bus system.

Compared to a 486/66, the only advantage the Falcon has is the DSP
and perhaps the sound system.
But as everybody knows, hardware without software is noware. Which
software is there on the market that _really_ benefits from the DSP?
Yes, there is MusiCom. But what else? Picture processing software?
Hypermedia software? The Falcon isn't automatically a multimedia
machine because it has a DSP.

Concerning CPU performance, the 486/66 is far superior to the 68030/16.
And for many applications, the CPU speed plays a very important role.
For example, if you want to generate a dvi-File out of a long LaTeX
document. A wonderful thing to test how fast your computer really is.

There are some other things that show that a 486/66 PC is far better
than you seem to want to admit. Compare just this:

For the PC:
A tower case (steel) with a powerful power supply, which can be placed

easily under the desk. No problem to place additional hardware in it,
e.g. a CD-ROM. No power supply problem for additional hardware.
Very good keyboard.

For the Falcon:
A keyboard case (plastic) with a weak power supply, which requires
more space on the desk - you can't even place it under a monitor.
Additional hardware is almost always external and for that reason
also more expensive.
Very _bad_ keyboard.

Just think about that seriously.

Chris.

4357. New Falcon simm board plus other stuff

Newsgroup: comp.sys.atari.st
Date: 1993-09-21 12:51:26 UTC
From: pd@mbuc.bio.cam.ac.uk
Message-ID: <1993Sep21.125126.10404@infodev.cam.ac.uk>
Source record: 200816

Has anyone heard or seen the new memory board for the Falcon called
Falconwing (stupid name if you ask me...)
It is a small board with the two connectors to join it to the motherboard,
with slots for 4 1mb or 4mb simms pointing outwards.

It looks _something_ like this with the simm sockets pointing upwards....

The cost is around 60 uk pounds not including memory.

Also there is are two new accelerators for STFM/MEGA ST's. These are 68000
clocked at 28 or 36mhz (I think they are the right numbers, somewhere around
there anyway). I thought 68000's weren't supposed to run this fast? Or am I
totally wrong again? (cost 199 uk pounds for the 28mhz, 299 for 38mhz)

I was considering buying a Falcon or maybe a TT to get some extra speed and
graphics. If I get one of the above accelerators for my Mega ST, the speed
increase won't be as fast because everything else is still at 8mhz (correct?).
So will it be better to buy one of the new machines so that _everything_ is
faster?

Why is it that just when I have _almost_ decided to get one thing, something
else comes out to change my mind? I won't get anywhere like this :-)

I think I need to kill off some rich, long forgotten relative to get some more
money!!!

Shopping list at the moment ...
multiscan monitor
100mb+ hard disk
accelerator / new computer (this could have a hard disk with it...)
calamus S (the black and white version, the full colour one is a bit overkill
for me)

From: gp93rjo@t.hfb.se
Message-ID: <gp93rjo.748622417@txfs1.hfb.se>
Source record: 200831

I posted an article last week asking for FSP sites for the ST/STE.
I have had some replies, but most of them think I mean FTP sites.
I do not. I want fSp sites. If there are any good ones. If anyone knows
where they are.
If anyone feels like telling me where....

Thanks
/Roger

>enhancements things that most users could live without???

You must understand that TOS 1.0 and 1.2, while entirely usable, were entirely
bug-ridden as well! Lot's of things did not work or at least, did not work
very well under these TOS versions (1.2 and 1.0 are nearly identical, BTW).
TOS 1.4, aka 'Rainbow TOS,' was the first major TOS upgrade and fixed most
all of the earlier bugs and added some nice new features (like an improved
file selector) as well. One of the best improvements was a total rewrite of
the disk caching scheme which improved read/write performance on both floppy
and hard disk drives. Personally, I'd consider TOS 1.4 a _mandatory_ upgrade
for anyone still using 1.0 or 1.2 for anything other than games. It's not
TOS 2.06, mind you, but the differences are well worth the small cost, IMHO.

Just my $0.02...

4364. ROM dumps...

Newsgroup: comp.sys.atari.st
Date: 1993-09-21 14:44:50 UTC
From: lancer@rajeesh.WPI.EDU
Message-ID: <LANCER.93Sep21144450@rajeesh.WPI.EDU>
Source record: 200833

I'm seriously considering upgrading my ST's TOS to 1.4 or 2.06. One thing I'm worrying about, though, is incompatibility with some of my older software. Are there any PD or shareware programs which let you dump an image of your ROMs to disk to be loaded later with something like quicktos?

Also, is it possible to use such a program to dump a "modified" version of TOS and GEM to disk? For instance, I boot my ST with lots of modifications to its old TOS 1.0... I use TurboDos (to speed up the hard drive), quickst (for faster VDI), etc... Could I dump my TOS to disk after loading these things and then not have to run them every time I boot up?

thanks...

Bob Brodie, in an online interview, was quizzed about the future of Atari computers. He couldn't give any details, but noted that there *are* additional machines planned and believes that we will be "very satisified" with them.

The likelihood of Atari *remaining* in the computer market is quite high.

My SC1224 color monitor has died on my 1040ST. I don't know what
wrong with it since I'm not a technician. I am not interested in
investing more money in this system so I've decided to sell it. I've
talked to a dealer and he was willing to buy some of it for the prices
listed below if I use it as a trade-in for something else. If anyone
wants to make a better offer, it is yours. All components are in
good working order except, of course, the monitor.

Component Dealer offer
--------- ------------

1040ST $200
1 meg RAM
TOS 1.4
AdSpeed 16 MHz accelerator
Mega-Touch keyboard springs
Atari mouse (< 1 year old)

ICD FAST hard drive $200
50 meg
Built in clock
ASCI in/out
SCSI out

SC1224 color monitor NONE
Screen is now blank
Good for parts

ST games (original disks and docs) NONE
Arkanoid
Silent Service
F-15 Strike Eagle
Warship
Red Storm Rising
World Games
Sub Battle Simulator
Harrier Strike Mission
Jewels of Darkness
Silicon Dreams

I think I have heard that Timeworks has problems but they are being
fixed at the moment. For Opus I don't know. I suspect it will not have
many problems, since all my programs work with Speedo without any
problem. All using the same setup. Maybe you need to limit the fonts
installed because your application will only show the first ten or so,
but most applications will be able to use them all.

Bernard

4376. Cubase Lite - Tastes Great, Less Filling

Newsgroup: comp.sys.atari.st
Date: 1993-09-21 18:08:02 UTC
From: daroloso@math.uwaterloo.ca
Message-ID: <CDpuDG.qn@math.uwaterloo.ca>
Source record: 200836

I recently purchased Cubase Lite and have a few questions for the experts.
I have been using it to enter songs from sheet music using the score edit.

1) How do you find and delete program changes? In one of the demos, "piano"
is my keyboard's "sound effects" ... I change the PRG for the track to
my keyboard's "piano" but the demo changes it back to "sound effects" half way
through.

2) In "Score" edit, I set SNAP and QUANT to 8 and the note cursor becomes
an eighth note but whenever I place it on a beat (tick 0) it is shown as
a quarter note with 96 ticks until I place another eighth note 96 ticks
after it.

3) A piece has a bar of 2:4 time signature in the middle of 4:4. Even when I
make the bar a separate part, a change in the time signature affects the
whole piece. How do I get around this?

There's no such thing as a stupid question. Poolfix fixes a bug
in TOS 1.04 that can cause the data in the internal GEMDOS memory
pool to be corrupted. This memory pool is used to hold
information on open directories and files. I think the bug bites
when GEMDOS tries to free up some space in the pool by purging
entries that are no longer needed, and Poolfix prevents that by
hooking itself into the GEMDOS calls that may cause this
information and purging unnecessary stuff from the pool in a safe
way before GEMDOS does so in its buggy way. This description is
just a faint recollection I have about the Poolfix issue, see the
docs that come with Poolfix for the real stuff. Poolfix should be
available from many ftp sites that carry Atari sofware.

From: selick@csa.bu.edu
Message-ID: <27no73$4st@news.bu.edu>
Source record: 200835

When printing out "real" color pictures on a hp deskjet + with 4 color separation (running the paper through 4 times with cyan, magenta, yellow, and black cartridges...works great!) the black pass seems to block out most of the effects of the color. Is there any way to take out any black in the spots where other colors exist, and get brighter pictures? Is there a way to change the color & tint/hue for the whole picture as on a TV set? I have tried a bit with using the draft mode on the black part, and it helps a bit. Also, on things which I create, or pictures like cartoons, this is generally not a problem.

Thanks,
Steve

CH> the Falcon design.)

On TT RAM? I was aware of this with ST ram, but I didn't think it was that way for TT Ram. And that is what I was pointing out with the benchmark comparisons.

CH> Obviously it did exactly what you'd expect; cut RAM access in half.

Not unless TT RAM is 16 mhz. I thought the whole point of TT Ram was that it ran at the full speed of the machine.

Additionally, comparisons against a TT running ST Ram showed that the Falcon ran about 65% to 70% of the speed of a TT running ST Ram.

For real world comparisons, my Falcon will compile a full version 6 Binkley style nodelist in about 4 minutes, where my MegaSTe ran right at 5 minutes. This is using the same software, memory configuration, caching scheme and hard drive. In ST Medium, my Falcon (without a screen accellerator of any kind) does screen redraws very nearly as fast as my MegaSTe did WITH Warp9. Given that Warp9 for the Falcon is out now, I fully expect screen redraws to be improved considerably. It would not surprise me for 800x600x16 (which is what I'm running right now) to be fully as fast as ST Medium was on my MegaSTe. And bear in mind that my MegaSTe was about 50% to 60% faster than my previous 520ST in nearly EVERY area. Also bear in mind that this is with software that was written for bog standard STs. None of the stuff I am currently running takes advantage of the specific features of the Falcon. As more and more stuff becomes available, I expect these numbers to improve.

That's funny...DM works perfectly on my 4meg STe... No problems at all!!
Maybe you have a screwed up copy?? Oh, and about CSB.. Well that works just as
well! :) Blimmin hard games tho.....

I'm using Cubase 3.02, dunno what has been omitted in Cubase Lite, but here goes...
>
>1) How do you find and delete program changes? In one of the demos, "piano"
>is my keyboard's "sound effects" ... I change the PRG for the track to
>my keyboard's "piano" but the demo changes it back to "sound effects" half way
>through.

Do you have a List Editor? (It's Ctrl-G in my Cubase...) That'll let you edit all MIDI events at the lowest level, you can find the PRG Change and delete it in there.
>
>2) In "Score" edit, I set SNAP and QUANT to 8 and the note cursor becomes
>an eighth note but whenever I place it on a beat (tick 0) it is shown as
>a quarter note with 96 ticks until I place another eighth note 96 ticks
>after it.

This confuses the hell out of me too, don't know what to do about it. I don't bother entering music in the score editor, it's too much hassle. The Key Editor is a lot handier...
>
>3) A piece has a bar of 2:4 time signature in the middle of 4:4. Even when I
>make the bar a separate part, a change in the time signature affects the
>whole piece. How do I get around this?

Go and edit the Master Track. Insert a new event at the bar where you want the time change (insert a new time signature). The master track is where you enter time, tempo, etc. changes...

The VDImgr should take advantage of newer features in MiNT, and is also compatible with any weird screen modes you might have from video expansion cards.
>
>- Are there any programs that make use of icons or any other graphical
> interphase?

Dunno. Not too many people use MGR, unfortunately.
>
>- When MGR is started, keeps my Mega STe running at 16MHz with blitter on?

I don't think MGR tweaks anything specific in the hardware, so if you're already running at 16 MHZ it'll keep it there...
>
>- Can you make a desktop like X-windows that, when you startup, auto-
>maticly some programs are started and icons displayed and so-on.

Don't remember. I think that's what the mgr.rc file is for...
>
>- Does anyone have a good comm-pack for mgr? I now use mgrterm, but
> I need (as a minimum) a vt52 emulation. But if you set TERM to VT52
> the program does not understand taht it is running in mgr. (because
> the only way to check, is to check the TERM var)

If the systems you connect to are TERMCAP based, you should just make them use the MGR termcap info. If they are termlib based, you will need to compile the MGR termcap description first, but in either case, there's no reason to limit yourself to VT52. If the problem is that you want to run TOS software on the ST that uses VT52 control codes, you can use the VT52 emulator in the contrib directory...
>

>
>Does anyone know of a cheap substitute for the Atari monochrome monitor?

Gee, I've seen Atari SM124 mono monitors going for $75 and as low as $50 here on the net. You can't get much cheaper than that.

If you want mono _and_ color capability, then the cheapest way is still an SM124 and an SC1224 color monitor. The NEC 3D monitors, long since out of production, are the most popular multisyncs for use on Ataris but you will still need a multisync adapter to make it work with your ST.

>Using Flash 1.6, I have NEVER had 9600 as a limit...
>everything works fine at 14.4K. Am I missing something in your remarks?

There is no problem with file transfers, using Flash versions up to 1.6,
but if you are reading text, more than a page or two, at speeds greater
than 9600cps, you will loose characters and get garbage on your screen.

4394. Falcon OS - what revision should I look for?

Newsgroup: comp.sys.atari.st
Date: 1993-09-22 00:44:55 UTC
From: karlm@highett.mel.dbce.csiro.au
Message-ID: <27o767$q76@news.dmpe.CSIRO.AU>
Source record: 200751

O.k. Guys.
I am able to get enough money together to buy a new computer, and I want to get a Falcon 030. The machines currently for sale are 4 meg, 80 HD set-ups, and I get the impression that these have less bugs (i.e. problems with the HD) than the 65 meg versions. I have gotten quotes and the prices seem to be not too bad, but the guy who I want to buy it off hasn't any in stock, because of the constant OS revisions, etc. He says that Atari Oz are getting in a new shipment at the end of the month, and these are to be a new batch with a revision of the OS, as Atari have found bugs that they are going to fix. What I want to know is what OS / Revision should I look for, as I need a new computer as like last month, and I don't want a really buggy one - hey I've got a 1040STf TOS 1.0(8) for that ....

There are some places around here with a few computers in stock, and I'd love to get one, mainly 'coz I really only have access to the money Thursday and Friday, and then it gets shut up in a big vault again.

Please Help ME!

(E-mail is best, but all replies welcome!)

Karl..

4395. followup and new MTOS problem

Newsgroup: comp.sys.atari.st
Date: 1993-09-22 01:54:07 UTC
From: michael@tapestry
Message-ID: <27ob7vINN69u@ymir.cs.umass.edu>
Source record: 200754

Hi,
Thanks to some helpful people, I got the information I need and am
happily running with MultiTOS, NeoDesk, and NVDI now. I really, really
appreciate the help.
For those hypersensitive enough to perceive a legitimate complaint about
one rather serious bug as just trendy Atari-bashing, I recommend lightening
up just a little (actually, a lot).

Michael Kieras
michael@cs.umass.edu

I do not speak for my employer.

4396. Atari equipment for sale

Newsgroup: comp.sys.atari.st
Date: 1993-09-22 03:07:22 UTC
From: basil@eniac.seas.upenn.edu
Message-ID: <148743@netnews.upenn.edu>
Source record: 200760

I have the following equipment for sale:

Atari Mega2ST (w/4 meg ram): $375 (includes shipping)
(Comes with many applications, most with original documentation: Timeworks DTP, Wordflair II w/ FSMGDOS, EditTrack, Laser C, Flash, Dr. T's Tiger Cub, Ludwig, Neodesk 3.1, Degas Elite, Microsoft Write and many public domain disks. Also included are the Compute Atari ST books on C programming and an Avatex 1200 baud modem)

Atari SLM804 with brand new drum, extra toner cartridge: $350 + shipping
-- Don't settle for any slower, still one of the fastest consumer printers out there. Add Composcript software and you have a great postscript printer.

SM124 monochrome monitor: $75+shipping

Spectre GCR w/ ROMS: $200 (includes shipping)
-- lets you into the world of Mac, runs most applications including MS Word, lets you exchange files easily

Please contact me by e-mail @ basil@eniac.seas.upenn.edu if interested.

4397. UPGRADE NOTICE __WARP 9__ to version 3.80

Newsgroup: comp.sys.atari.st
Date: 1993-09-22 03:16:49 UTC
From: dlk0ms9s@umiami.ir.miami.edu
Message-ID: <1993Sep21.231649.15814@umiami.ir.miami.edu>

I just got this off GEnie this weekend and knew everyone here would want to know about it.

-Mark Santora
<-->

For immediate release

CodeHeadQuarters
Friday, September 17, 1993

```
.................................................
: :
: CodeHead Technologies announces Warp 9 3.80 :
: :
: Including Extend-O-Pak :
: :
:...............................................:
```

The long-awaited upgrade to Warp 9 is here!

Feature List
----

o Fully compatible with the Falcon 030 computer.

o Fully compatible with SpeedoGDOS.

o Seven completely new Extend-O-Save modules!

o Seven of the previously-released modules have been enhanced, adding Falcon compatibility and new features, such as Alternate Screen, Test mode, Falcon "true color" support, and more.

o A newly-designed Warp 9 Control Panel provides easier access to all options and allows you to configure which page of features will appear upon the opening of the accessory.

o A new program, Extend-O-View, runs as an application for Extend-O-Save modules so that you can simply double-click on modules to load and view them! Or install Extend-O-Save modules right in your HotWire menu to select them with a single keypress or mouse click.

o A new accessory, EOS Timer, handles a new generation of Extend-O-Save modules which operate through the GEM event system. This allows modules to do disk access, and make many other types of system calls previously unavailable to Extend-O-Save modules. The Slide Show module

mentioned below makes use of these new features.

o New MakeFast program provides users of TOS 1.0 and 1.2 a faster bootup of Warp 9.

o Now comes on two floppy disks containing over 1.3 megabytes worth of files. Disk two contains 20 Extend-O-Save modules from CodeHead Technologies and eight modules from other authors.

o Includes a 30-page manual addendum documenting all new features and Extend-O-Save modules.

New Extend-O-Save Modules

Slide Show - Picture files are displayed in an automatic slide show. The slide show displays pictures in any of the formats supported by Warp 9, including beautiful 256-color pictures on the Falcon 030.

Flying Thrones - A take-off on the popular Flying Toasters screensaver available on other platforms. Flying Thrones includes a separate program which allows you to load your own images/animations. Due to trademark restrictions, we can't release a clone of Flying Toasters, but now you can create your own version.

Rain, Man - Expanding circles appear on the screen, like drops of rain water hitting the ground.

Things That Go Bump... - The blinking eyes of various creatures randomly appear and disappear, accompanied by optional night sounds.

Spotlight - A circular section of the screen roams around a dark background as if a flashlight or searchlight were lighting it.

Filled Shapes - Random shapes with variable number of sides appear randomly, filled with random fill patterns.

RAM Page - The screen fills with an ASCII representation of the internal memory of your computer, providing page after page of interesting and unique screen displays. You might be surprised at what you've got inside -- and it's not Intel.

Availability

Warp 9 3.80 with Extend-O-Pak is available now. The retail price remains at $44.95. Owners of previous versions of Warp 9 can upgrade to v3.80 for $25 plus $3 shipping ($4 Canada, $6 overseas). Send us your master disk and $28 to receive the upgrade. For more information, contact your local dealer, or:

4398. Help with Falcon audio input!!

Newsgroup: comp.sys.atari.st
Date: 1993-09-22 04:37:05 UTC
From: kendall@flammulated.owlnet.rice.edu
Message-ID: <KENDALL.93Sep21223705@flammulated.owlnet.rice.edu>
Source record: 200688

I have a problem with my Falcon and sampling that I sure hope someone here knows the answer to...

Whenever I hook up a stereo cable between my Falcon and the headphone jacks on my stereo, all I get is a horrible HUM from the Falcon, and garbage (but load garbage) for the input instead of what I am trying to sample.

Hooking up a microphone works OK, why can't I seem to sample from my stereo?

Thanks,

--

In article <1993Sep19.101035.16802@cobra.uni.edu>,
Wanna buy one? My Atari dealer just 'round the corner has one in stock, and has
>> been selling some of them...
>
>No thanks. I want a laptop that has at least an 030, not a 68000.

I'd gladly settle for an STBook if the price is right. What is
it?
A 68000 beats anything up to a 486 in my opinion and for my
applications. The question is purely price. Are the Books cheaper in
Europe??
How do the compare with Macs and the lesser clone notebooks?

4400. New program on comp.binaries.atari.st!

Newsgroup: comp.sys.atari.st
Date: 1993-09-22 05:00:25 UTC
From: ph9991_imm@rivers.acc.uwrf.edu
Message-ID: <1993Sep21.230026.1630@rivers.acc.uwrf.edu>
Source record: 200758

Located on comp.binaries.atari.st is a utility that I designed which runs other GEM or TOS programs. You may do this at startup, or run the program anytime. I have a stock 1040STe, and it works perfectly. Check it out! It's free! All you need is 200KB (approx.) and programs whose memory requirements don't exceed 100,000 Bytes. I use this to run STBlank's accessory as a program, set-up the screensaver, and NOT have any accessory taking up ram space. (plus a couple other programs run at boot too.)
If you like it, write to me below, or if you don't like it write to me below.
You can't lose!

Source record: 200763
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello,

I haven't read this newsgroup before, but I hope that someone will be able to help me out. I'm about to enter the world of MIDI, and having an Atari ST at home I was thinking of trying some of the PD MIDI programs available at the many ftp sites.

Now, my question is: I don't have a modem, so would it be possible for me to download the files to a PC/Sun WS, and copy them to a floppy that the ST would be able to read? I seem to remember that the disk-format is different between DOS and the ST, but is there a way to get around it (hardware or software), other than getting a new disk drive for the ST?

Cheers,
Pelle ,,, ?

Get a Falcon it will be about the same speed as the 28MHz, but you also
get a hard disk, MTOS, Speedo, much better graphics, up to date TOS, and a
DSP.

>>I was told by one source that if I found empty pads (to drop 256k x 1
>>dip ram
>>into) in a 520STFM that I would also need to add some series resistors to
>>make the ram upgrade work. Another person disagreed.
>>

>I did several times, all you need is the RAM chips: 4x 414256-120 SOJ. (And
>don't drink too much coffee before soldering, you'll need FULL control of your
>hands and fingers - it's a very delicate soldering job...

When I upgraded my 520STFM, I fitted the empty bank of ram (16 x 256Kx1) and
I also needed 3 resistors. These resistors (on my STFM anyway) are series
damping resistors and connect the signals RAS, CAS and WriteEnable thru to
the ram being installed. If they are omitted then these signals won't reach
the new bank of ram.
If you look at the board near the ram you should find three empty places
where resistors are marked but not installed. Use a value of approx 47 ohms
or thereabouts (or look to see what the existing values are for the existing
bank of ram).
You should be able to use 150nS ram without any problem.

There seem to be many variations off STFM boards in circulation so you will
need to look at the board to find out which advice is applicable.

There is an article at atari.archive.umich.edu which has details of upgrading
to 2.5M and if you can afford the rams then this is well worth it.

Happy upgrading
Dave Foy

4407. Re: Falcon OS - what revision should I look for?

Newsgroup: comp.sys.atari.st
Date: 1993-09-22 09:36:06 UTC
From: Iain.Laskey@barclays.co.uk
Message-ID: <CDr1C9.BwC@barclays.co.uk>
Source record: 200705

Anything from 4.02 onwards is OK. 4.01 is broken badly. The current version AFAIK is 4.04 and that's what I'll be upgrading too soon.

Note: My answers are based on `real' Cubase, I'm not sure what features are
missing from Lite...

>1) How do you find and delete program changes? In one of the demos, "piano"
>is my keyboard's "sound effects" ... I change the PRG for the track to
>my keyboard's "piano" but the demo changes it back to "sound effects" half way
>through.
Use Grid Edit, ensure that the list of events displayed includes program
changes by checking that the 'pc' in the box about 2/3 across the top of
the window is in upper case. If in lower case then program changes are not
displayed. Then select and delete the events.

OR: Filter program changes.

>2) In "Score" edit, I set SNAP and QUANT to 8 and the note cursor becomes
>an eighth note but whenever I place it on a beat (tick 0) it is shown as
>a quarter note with 96 ticks until I place another eighth note 96 ticks

Not sure, I don't use score edit.

>3) A piece has a bar of 2:4 time signature in the middle of 4:4. Even when I
>make the bar a separate part, a change in the time signature affects the
>whole piece. How do I get around this?
Time signatures should be set using the Master Track. This enables you
to specify that the song is in Common Time, switches to 2/4 at bar 23, say,
then back to 4/4 at bar 24. This is where you put any tempo changes too.

Yes: TimeWorks
No: Opus (haven't got Opus, so haven't tried this).

With TimeWorks, you have to do a bit of fiddling to get fontwid.app to run; it was explained in a recent magazine article (Atari ST Review, if I remember correctly).

BUT: You won't be able to use your old PostScript driver, and THERE IS NO POSTSCRIPT DRIVER WITH SpeedoGDOS. Aargh! How are you supposed to get quality output when the best you get is LaserJet? The SpeedoGDOS manuals certainly weren't printed using SpeedoGDOS!

>I'm seriously considering upgrading my ST's TOS to 1.4 or 2.06. One
>thing I'm worrying about, though, is incompatibility with some of my
>older software. Are there any PD or shareware programs which let you
>dump an image of your ROMs to disk to be loaded later with something
>like quicktos?

I have written such a thing when I was testing several TOS patches before
burning them into EPROM. It consists of romsave.ttp, which dumps the ROM
to your hard drive, and starttos.ttp, which loads the dumped TOS to RAM
to start it. starttos also needs a relocation file, which contains all
absolute addresses to relocate. I have such files for TOS1.0, 1.02, 1.04.

Mail me, if you want binaries or source code of these tools.

Urs

I use Cubase 3, never used Lite but hopefully my answers still apply.

>1) How do you find and delete program changes? In one of the demos, "piano"
>is my keyboard's "sound effects" ... I change the PRG for the track to
>my keyboard's "piano" but the demo changes it back to "sound effects" half way

Go to List Edit (I think Lite has it) and search for the program change
event. If you want, uuencode the file and I'll remove it for you.
>
>2) In "Score" edit, I set SNAP and QUANT to 8 and the note cursor becomes
>an eighth note but whenever I place it on a beat (tick 0) it is shown as

>make the bar a separate part, a change in the time signature affects the
>whole piece. How do I get around this?
>

You need to use the MasterTrack. There you are able to set time signature
and tempo changes per song position. It's quite simple.

>work! Please help!

>See ya!

>Christiaan Kamstra

Keep away from him. This missile got a performance radius of 5000. This will
be later developped for you, but not when in clinch with the bezerker.
The only way is to annoy him very much. Just keep shooting at him when you've
successfully identified him. Fire everything at every encounter.
Soon he will be after you, not the earth. Then you will be entitled for a
mission towards a target of your own choosing, as long as it is not the earth or
solbase. Find out for yourself.... :-)
For the missile: ever thought of shooting it ?
That's it, Dirk

4413. HELP! zoo file format

Newsgroup: comp.sys.atari.st
Date: 1993-09-22 10:31:35 UTC
From: thuerman@ibr.cs.tu-bs.de
Message-ID: <1993Sep22.103135.7550@ibr.cs.tu-bs.de>
Source record: 200770

I've posted this in comp.compression before, but got no answer. Maybe
atari freaks are more willing to help.

I have accidently overwritten the first 90 or bytes of two zoo archives.
With fiz I can recover all files but the first in each archive, although
it seems only the header of the first files are corrupted, not the data.
Can anybody mail me a descrition of the format of zoo files, so that I
can repair the archives by hand.

Please, don't let me dig into the zoo source code.

thanks
Urs

4414. Re: followup and new MTOS problem

> I have a hard-drive and am running TOS 1.2 with no problems. Are there some
> bug fixes in TOS 1.4 that would make it worthwhile to upgrade, or are the
> enhancements things that most users could live without???

In general, operations on hard disks are sped up by several factors
when using TOS 1.04 (compared with 1.02 and 1.00). Apart from that,
TOS 1.04 fixes some serious GEMDOS problems that could in the end
wreck your files, and it alleviates the FOLDRxxx problem a lot.

If you're thinking about an upgrade, however, you should probably
consider investing in TOS 2.06 and an expansion card for it.
This will give you the new Desktop, speed and functionality
improvements, and a larger address space for the TOS ROMs, i.e.
the possibility to upgrade to upcoming bigger TOS versions.

Jonas,

There is no big problem in using the SLM on a TT (I use two such systems). The only prob. I have with GDOS printing is that you must switch off the cache before printing; if you don't, the TT tells you printer (or driver - I forget) not found.

Dear everybody,

I'm looking for the libraries which will enable me to
use the 68881 math. copro in my MegaSTE with GCC.
As I understand, I need the line-f libraries.

the sfp04 or so libs don't work (the one at a.a.). Of course.

Or is there another trick?

Like include math-68881.h instead of math.h? Can pml do the job
somehow? I tried, but it didn't work...

Any help appreciated!

Please mail me at goltz@epdpri1.dpri.kyoto-u.ac.jp, as I can't
read news often.

Many thanks in advance from Kyoto,

Christian Goltz

>keyboard, mouse GBP950. No contest.

Sure, the 486/25 is faster at pure number crunching, but when you load the
OS it's a different story - TOS is much faster than Windows and
forthcoming versions of MTOS are almost as fast as TOS (about 90%).

|> How do the compare with Macs and the lesser clone notebooks?
The ST Book looks great BUT it's just a bog standard 8Mhz 68000 with 1Mb RAM and a small(40Mb?) HD. In the UK they cost 1275GBP which is about 2000USD. It's probably the equivelent of a 286 PC laptop circa 3 years ago. In it's favour, it's very nice to use, very compact indeed and has nice built in utilities. It has no floppy though. :-(

>>> The Jaguar was brought up because Atari has virtually abandoned the
>>> Falcon already, putting (according to Bob Brodie, just to satisfy
>>> Warwick's curiosity) all its resources ($35 million, down from the
>>> $50 million they said they had to launch the Falcon) toward launching
>>> the Jaguar.
>>>
>>> They haven't abandoned the Falcon, this is plain BS! Just because
>>> they're investing a lot of money in the console market does not mean
>>> they give up the computer-market... The money they make on the jaguar
>>> will probably be used to develope new Falcons...
>>
>> One would think that if the Jaguar makes money that Atari will
>> reinvest most of the money in the Jaguar. (It'll maximize their
>> return).
>
>Oh yes, and simply let all the money they have already invested in the
>Falcon-line go to waste? Probably not! Why do you think they have continued
>making computers thus far?

If you had a Jaguar line which was making money and a Falcon/ST line
which was was losing money (or at best, just breaking even), where would
you spend your money?? Jaguar, of course. Let's make it better. Let's
get even better software, etc.

The Falcon being a niche computer doesn't help. (It's easier to find Atari
products in music stores than computer stores. When Joe Consumer goes to
buy a computer, will he visit a music store or a computer store? Even if
he wants the computer for music/MIDI, the sales droids will steer him
to an IBM or MAC machine. "This is just what you're looking for".)

Competing with the MS-DOG world is like trying to stop an avalanche.
To make the Falcon/ST competitive, Atari must advertise the hell out of
the machine. (Remember how Atari used to advertise in the past? Anyone
remember the Alan Alda TV spots??) They must build a dealer base of
COMPUTER dealers. Not just music stores. Atari's been building up their
dealer network for how many years??

Someone posted a way to do this. You need to get fire everything you've got at the Berserker and get him to follow you and then use Quadspace to get to the black hole and the Berserker will hopefully follow you and get sucked in while you escape because you move faster.

I have a few games that no longer work on my Mega 2 ST since I put in TOS 2.06.
Is there a patch or something that I can use to get these games to work?
Specifically Robotz and Warhead? Any help would be appreciated.

Hi,

S>Does anybody know if CSB will run on an Atari 1040 STE
S>Dungeon master dos'nt work on mine, It still works on my old 520 ST.

Dungeon master and Chaos strikes back works well on my Falcon 030. I think there are some differences more between Falcon and ST as between STE and ST. SO I think CSB will work on a STE. On the STE of a friend from me both games work well too. I can't imagine why Dungeon master dosn't run on your 1040STE.

Tschau,

/Martin/

Jean-Etienne Doucet

Here's all of the postings of patches I received (note that I'm not
the author, and I still haven't received my copy so I can't be sure
how well it works:

Someone reported a bug happening on the city status of cities far from the
capital, which resulted in a bus error. After debugging with MonST, I
discovered that this bug occured in the routine darkenning the commercial
revenues (which seems to be totally useless on ST), when the corruption losses
are higher than the revenues themselves (which should be impossible). This
seems to happen only in anarchy.
As Microprose doesn't seem to answer, you can prevent this thing in the
following way:

In the file GAME.PRG, search for the sequence
4EB9 0005 737E 4FEF 0014 700D 3F00 (sector 176 of file GAME.PRG),
then replace 4EB9 0005 737E with 4E71 4E6E D03B

You can E-Mail me if you have any trouble.
One last thing about this game, I wonder if it is not easier to win on ST
than on PC. After several easy victories, I never met a civilisation that
was really developped (even on king level). Does anyone have the same
sensation ?

The bug fix I gave on this newsgroup couldn't work on every configuration !!!
Shame on me, I'm so bad that I guess I could be a Microprose programmer. Here's
a bug fix that should work in any case:

In the sector 176 of file GAME.PRG, look for the sequence
3F03 3F02 2F39 0006 024E 4EB9 0005 737E 4FEF 0014, or,
if you made my silly bug fix 3F03 3F02 2F39 0006 024E 4E71 4E6E D03B 4FEF 0014
then change it to 6000 000E <<<<<<<<<<unchanged>>>>>>>>>> 4FEF 000C

Good conquests !!!

> availibility, etc...

It's not a stupid question. While removing the bugs in the TOS memory manager, a new bug was introduced in the routine that coalesces free memory blocks. POOLFIX is a program that intercepts memory allocation and freeing requests (and other calls that indirectly allocate / free memory) and coalesces the blocks itself. Hence the buggy routine never gets a chance to run.

In the UK, the TOS 2.06 extension card is marketed by COMPO. I don't have any info. on the US supplier.

It sounds as if you need Jeremy Hughes ImageCopy, which allows you to fiddle with all sorts of parameters (including all the ones you mention) when printing to colour Deskjets.

I don't have a copy myself, but it gets rave reviews and I've yet to meet anyone with a bad word to say about it.

4439. TT Stereo Sound

Newsgroup: comp.sys.atari.st
Date: 1993-09-22 17:48:55 UTC
From: gruber@austin.ibm.com
Message-ID: <CDro5J.2uq5@austin.ibm.com>
Source record: 200794

I tried as was suggested in this newsgroup to enable me to use the stereo sound of my TT to turn off the speaker, which should have re-directed the sound to the stereo jacks.

Well it didn't work, what I did was used the xcontrol panel but to no avail also I'm running NeoDesk 3.3.

When I did turn sound off using xcontrol I did hear some kind of sound but very faint, from what I understand there should be stereo amplifiers wired to these RCA plugs.

Is there anything I'm doing wrong or need to do ?

Thanks,
Scott

4440. For sale: Color monitor/hi-res tv for Atari ST

Newsgroup: comp.sys.atari.st

Cross-posted to: uva.want-ads,comp.sys.atari.st

Magnavox 8cm-515 color monitor w/ custom cable for Atari ST.

Better than Atari; 14" (vs. 13), better made, useable with

IBM-comp's, Amiga, and composite-video machines (Atari 8-bit,

C=64, vcr, ld player) as well.

* Includes $40 custom 8' cable for Atari ST; separate sound

jack for running sound thru stereo.

* FANTASTIC picture when used w/vcr or ld as hi-res tv; better

than any tv-set! Ideal for one needing both monitor and tv

in a small space. Can even have BOTH on and switch between!

Excellent condition.

$250 + shipping.

4441. elm for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1993-09-22 18:17:29 UTC
From: dunham@mpd.tandem.com
Message-ID: <1993Sep22.181729.11453@integrity.uucp>
Source record: 200788

Is anyone aware of a version of elm being available for the Atari ST series of computers? I'm actually looking for just a subset of the normal elm functions. I don't care (yet) if it can mail messages; I just want to use it to read elm-created mail folders that I've moved from my Unix machine to my Atari ST. Any non-elm program that can do this (pine?) would be also welcome.

ADVthanksANCE.

>forthcoming versions of MTOS are almost as fast as TOS (about 90%).

[[Before starting the inevitable Dos flme replie, please keep in mind
that I have been a solid supported of Atari computers since 1986, and
have happily spent a lot of money adding the great hop up parts
available to make my mega4 as fast as I could afford.]]

Sorry to have to disagree with you, Ofir, but I have had a 14 meg
Falcon and an 8 meg 386/40 sitting here beside each other on my desk,
and in general the working feel of a Falcon running the Atari Works word
processor in 640x480x256 was even slower than the feel of running Write
and 600x800x256 in Windows. If you leave Multitos off, then they're
about neck and neck. Both of course can be spead up by using different
screen resolutions. And if you go into pure dos mode on the pc, and test
mode on the Falcon, the 386 walks all over the Falcon.

In general, I found when working in 256 color mode on the Falcon,
that it felt less responsive than my AdSpeed equiped Mega4. I think if
Atari could have offered an entry Falcon with 4 meg and a 40 meg HD for
somewhere in the CAN$800 range, they might have had some success. But
only with a peppier machine also available for us power junkies. And I
don't mean the TT, as I'd want all the new features of the Falcon, but
about twice the speed.

I think Atari has screwed up big time by not offering a faster
model, in a seperate case, as a step up model. Anyone who has used a
mega for a year or so is going to hate going back to a standard ST. I
can not understand how Atari can ship such junky keyboards on ST's. You
can get a PC keyboard for $35 that feels better than the mega STe
keyboard, which is the best keyboard Atari has ever made. (OK, the
STacey was bettter, but that ridge on the case was a killer)

Anyway, enough. I've set followups the advocacy, let's try not to
annoy the folks who don't want to hear this stuff.

No, while a line-F library would be nice, no such library exists yet. However,
the existing GCC library will work fine, you just need to recompile it with
sfp004 defined, so it will use the 68881 peripheral code instead of the 68000
code.

Try Best Computer Supply in San Jose, CA. I don't have the number here at the office, but if you can't get it through information, E-mail me and I will bring it from home. They have parts for most all Atari models including some 8-bit stuff. They, in particular, build a power supply that is quite a lot better than the original Atari 1040 supply and will go right into the machine in its place. They also carry a very nice replacement mouse. Good luck.

>And for many applications, the CPU speed plays a very important role.
>For example, if you want to generate a dvi-File out of a long LaTeX
>document. A wonderful thing to test how fast your computer really is.
>

This whole shouting match (over in *.advocacy, anyway) got started when I reported Bill Rehbok's results from CeBIT: it took a '486 @ 66 MHz 6 seconds to perform a benchmark performed by an Atari in *4* seconds. There's been a lot of healthy disbelief, and a surprising lack of name calling in the last month or so. (It's nice to know we agree to disagree in comp.sys.atari.advocacy!) Overall, it's been quite an exhilarating line of discussion. Several talented debaters have come and gone, but the thread continues....

BTW, most of the comparison activity has been system performance, not CPU performance.

>There are some other things that show that a 486/66 PC is far better
>than you seem to want to admit. Compare just this:
>
>For the PC:

Never underestimate the importance of ergonomics, true! That's all the more reason to consider a MegaSTE or a TT instead of a

Falcon, I suppose....

4451. Atari UUCP Programs

Newsgroup: comp.sys.atari.st
Date: 1993-09-23 00:29:35 UTC
From: bhawker@ham.almanac.bc.ca
Message-ID: <1J1aac1w165w@ham.almanac.bc.ca>
Source record: 200742

I am trying to set up my own UUCP site and am running an Atari 1040 STe with 4 meg, and a Syquest 44 HD. I have been experimenting with Waffle running under PC Ditto ver.3 and MS-DOS 3.3. This set up works to a point, but is dang *slow*, and other problems are occurring. (I'm amazed that it works at all). Anyhow, I was wondering what other Atarians are using for UUCP software?

I have heard a little about Hermes 1.03b, but is it true that documentation is only available in German? Are there any other prgms that should be looked at that would provide me with a UUCP connection at home? I don't have a Dos box, and would prefer to run it on my Atari.

Thanks for the help,
Bruce.

: Cheers,
: Pelle
All you have to do is format a disk in 720K under DOS, and it'll work
perfectly in the ST. In fact, it'll work in a recent Mac as well. I use
a 720K DOS format for shoveling files between my ST, and the university's
Centris 610s and PC clones. Really handy. Also, if you have TOS 1.4 or
higher, ST disks are formatted as DOS automatically.

He should use a program called FATSPEED like I do then. Disk access and
dfree() are increased to near TOS 1.04
speed.

>I tried as was suggested in this newsgroup to enable me to use the stereo sound
>of my TT to turn off the speaker, which should have re-directed the sound to
>the stereo jacks.

The stereo jacks are active regardless of whether the internal
speaker is on or off. At least with all TTs I've come across so
far.

>Well it didn't work, what I did was used the xcontrol panel but to no avail
>also I'm running NeoDesk 3.3.

>When I did turn sound off using xcontrol I did hear some kind of sound but very
>faint, from what I understand there should be stereo amplifiers wired to these
>RCA plugs.

Perhaps you need to turn on the volume, using the sound cpx, to
the max. level. And, do you mean you expect stereo amplifiers
inside the TT? There are none. The jacks are supposed to be
connected to the line in (or CD or aux or whatever called) jacks
of your stereo system.
I have my TT sound connected to the line in of a portable
radio/tape recorder unit. Works fine for me.

4457. tar with SCSI support

Newsgroup: comp.sys.atari.st
Date: 1993-09-23 01:29:07 UTC
From: sourada@iastate.edu
Message-ID: <sourada.748747747@vincent1.iastate.edu>
Source record: 200712

(I keep asking questions like this. Maybe my resourcefulness isn't as good as I thought it was...)

I would like a fast, newish tar with SCSI streamer support. The best one I currently have is Alan Hourihane's port of GNU tar 1.10 with TapeBIOS support, but this has a few problems: it's a fairly old version, and it's got some bugs that I'd rather not live with. I have tried to use Gemar, but it has two problems: it's in German (and I don't want to pay a shareware fee just to see if I want to use a program or not...), it's GUI based and I'd prefer command-line, and I don't think the unregistered version is tar-compatible anyway.

So if you know of any of the following, please tell me:
1) the source to the TapeBIOS version of the above mentioned GNU tar port. I am fairly sure that every source I have seen is the older one without TapeBIOS support.
2) a new port of GNU tar with any kind of SCSI support (not necessarily TapeBIOS).
3) a device driver for MiNT that emulates the /dev/rmt... of unix.
4) a library for MiNT or TOS that would allow me to compile GNU tar pretty much out of the box for SCSI support.
5) anything else you can think of

I suppose if I don't some good leads on this stuff, I'll eventually add my own TapeBIOS support to the newest GNU tar, but I don't know if I trust myself to do that correctly. :-)

Thanks a lot,
Steven Ourada yet again

I guessed you missed that bit of market analysis that showed computer
sales _rising_ over the rest of this year.

> Not competitive? It takes a '486 @ 66 MHz MS-DOS machine to keep up
> with a 68030 @ 16 MHz Falcon, and it's the *Falcon* that's not
> competitive???? <incredulous look> One needs to spend a thousand
> dollars _more_ just to get the same performance as a Falcon, yet
> the *other* machine is 'competitive'? <even more incredulous look>

I guess you missed all those posts by myself (and a cast of thousands)
showing how the aforementioned '486 absolutely CRUSHED the LIFE out of
the Falcon when it came to real work... like raytracing. :-)

I guess you missed all those posts (and all those many, many magazines
at the local <whatever> store) showing that a _complete_ '486dx/33
system _with_ the monitor is the cost of a Falcon030 _without_ a
monitor.

Or maybe you're just ignoring them since you don't believe that anything
could be better than the Falcon. How do you feel about the new AV Macs?
They're based on a nice fast chip (68040) and have a nice fast DSP which
is probably better than the one in the Falcon (from the specs it looked
a bit better; I haven't seen anyone claim either way though).

> And knowing that the rate of change will make the 'other' machine
> obsolete in about three years is more competitive than a machine that
> remained usable and productive for eight years? <thoroughly
> incredulous look>

Oh, I guess PC owners are somehow prevented from doing exactly what
you've been _forced_ to do... ie, keep using the same software for the
better part of a decade. Does Mickeysoft somehow _force_ everyone to
buy the 'latest' version? I'll bet you there are more WordPerfect 5.1
users than there are Atari users, and that's an 'old' version lacking
many of the wonderful (?) features of WP 6.0.

> I don't think so. The MS-DOS machines appear to be the ones that
> are 'not competitive'.

Then, maybe, just maybe, people will have brains and STOP USING DOS.

> You're right, they _can't_ demo the Jaguar yet. But if Atari was
> using "all its resources ($35 million, down from the $50 million they
> said they had to launch the Falcon) toward launching the Jaguar",
> then they would *not* have been at the show at all. My point: Atari
> is still actively marketing the Falcon.

No they're not; they never started. You keep ignoring the people saying
that the 'great Falcon demo' that was being discussed was put on
completely by user group personelle; not a single Atari worker was present.

> In another response, I've copied a question posed to Bob Brodie of
> Atari and his answer relating to future Falcons. In short, Bob says
> there will be more of them coming down the road.

That's the line he's been feeding us for over a year; still no plans to
actually _release_ one though. It doesn't take massive amounts of
resources to _plan_ your company's future, does it?

What the heck would you expect Bob Brodie to say in answer to that question? Isn't this the same guy who was telling people for months that FSM-GDOS was delayed because the packaging was later, while in actual fact Atari had long before decided it was a dog and would never be shipped. I tend to take anything said by Bob Brodie with a large box of salt, as his track record is fairly dismal.

That's simply because you don't have NVDI. With it, text is about 9 times faster and graphics about 4-5 times faster. How does that compare with your 386?

As I said, current versions of MTOS are slow, agreed. But just wait for the next release...

Hi there netters,

I was wondering if there is a version of the curses library
for MINT running GCC? The one that I have is the BSD version. I was
just wondering if there is one for System V where I can use the
enhanced commands. Any one ported it onto the Atari platform ?
Any info would be very much appreciated.

Thanks.

regards
Gary Chan

I don't know where to get NVDI in America, but you could order it from the UK. Try +44 81 693 3355 for System Solutions, they are the official UK distributor. Price is 50UKP (about $80). Worth every penny (cent).

Ok, boy.
I'm sorry to tell you that I have a Falcon 4/65, from the first ones sold in France
( that is whith TOS 4.01 a.s.o ) and I have NEVER had any trouble with it !!!!
The oonly HD problem I had was when I tryed to put my old SCSI HD on it, my AHDI
revision was buggy. Since I have AHDI 6.05 ( and now 6.06 ) NO MORE PROBLEMS !!!!!
So don't worry too much with OS revisions or things like that and buy a Falcon
asap !!!!

4467. HD disk drive with spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1993-09-23 09:26:42 UTC
From: bco107@cd4680fs.rrze.uni-erlangen.de
Message-ID: <27rq4iEt0u@uni-erlangen.de>
Source record: 200728

Hi!

I am running a spectre GCR (Mac-)emulation on my atari mega/ste.
The HD floppy disk drive, I have, works well both with DD and HD disks.
However, on the Mac side there are major problems: I know well that the
emulation cannot handle HD disks; but DD disks cause all kinds of error
messages, as well.
Does anybody know the reason for these problems or, even better,
how to avoid them?

Thanks, Matthias.

4469. IdeaList UK Registration

Newsgroup: comp.sys.atari.st
Date: 1993-09-23 09:39:34 UTC
From: lpzssm@mips.ccc.nottingham.ac.uk
Message-ID: <27rqsm$8oc@unicorn.ccc.nottingham.ac.uk>
Source record: 200669

IDEALIST

REGISTRATION OFFER

As an incentive to get people to register IdeaList I'm organizing (with the author's approval) a group UK registration - no need to worry about changing currencies, money order expense etc. For the unconverted, a brief description of IdeaList appears at the end of this.

HOW IT WORKS

The UK registration fee is 9 pounds. All registrations sent to me by the end of November will be converted to DM and sent to the Christoph (the author). You will then be sent the latest English version of IdeaList and supporting programs (such as IdeaBook), and be notified of future upgrades.

IdeaList 3.4 should be ready by then and will include:

- RTF import so you can print out files from most PC word-processors, as well as Atari-Works.
- Foot-line printing - add your own foot-line to the printout of any text file with directly-selectable text attributes.
- Import of First Word Plus head/foot lines
- Read ASCII lists for batch-printing with the printer-queue facility
- Enhanced interface with window-based dialogues (open several at once) and optional "dialogues at mouse position".
- revised English manual

Please make cheques payable to Sam Marshall and send them to:

Malgrat
Manor Park
Ruddington
Nottingham
NG11 6DS

Don't forget to include your own address ! If you include an e-mail I'll acknowledge receipt immediately. Otherwise, please allow until mid-December to hear from Cristoph.

IDEALIST DESCRIPTION

IdeaList is a comprehensive printing utility. It can output ASCII and First Word (Plus) files in up to 9 columns with proper formatting, add its own headers, print in batches, reverse order, odd/even pages only etc (anything you'd expect from a top WP's printing facilities).

Drivers are provided for a huge range of printers, including Epson FX, Star 9 & 24 pin, SLM, Deskjets (several including landscape), BJ10 etc. Drivers can be modified to include font-downloading and other printer-specific text-attribute control. Output can be re-directed to a file containing embeded printer codes and printed later from the desktop (or even on a PC).

The interface is very well done, with page-preview modes, keyboard shortcuts and preference options for just about everything.

The accessory version is almost as fully-featured and also offers background printing so you can run another application whilst IdeaList does its stuff even on a normal ST.

See last month's ST Review and ST Applications for more information (Review said it was one of the best pieces of shareware they'd seen). Even better, take a look at the real thing -

ftp from src.doc.ic.ac.uk
/computing/systems/atari/uni-paderborn/tools/printer/ideal321.lzh

Also available from Floppyshop and the ST Club.

I'll be happy to answer any questions by e-mail

4470. Atari Compendium question

Newsgroup: comp.sys.atari.st
Date: 1993-09-23 11:43:24 UTC
From: error@blade.stack.urc.tue.nl
Message-ID: <27s24s$atl@tuegate.tue.nl>
Source record: 200731

I read about 'the Atari Compendium' and from what I read about it it seems to be a great book. Really an English alternative for the Profibuch. Has anybody on the net already bought it? And is it as good as it appears from the press release? Does it contain many useful hints on how to avoid compatibility problems? Impressions please...

Erlend.

4471. Pure profiler and DRI objects?

Newsgroup: comp.sys.atari.st
Date: 1993-09-23 11:46:47 UTC
From: error@blade.stack.urc.tue.nl
Message-ID: <27s2b7$av4@tuegate.tue.nl>
Source record: 200732

I read in ST Magazin that the Pure profiler can also use DRI type objects. Does that mean that I could profile any program written using a compiler that generates DRI type objects? Heat 'n Serve C for example? Do the objects have to be compiled with debug info or not? And what can't be done using DRI objects that can be done using Pure ? objects?

Erlend.

Music store employees are going to be just like the bozos at Future Shop
or some other electronics store that sells lots of different stuff;
they'll see the '16Mhz Falcon030' and the 25 and 33 Mhz Macs (based on
the '040 or the '030) or the 25 and 33Mhz '486 machines and think "Gee,
bigger numbers for less $$$! K00L!" If you don't know anything about
computers (like probably 75% of the people selling them and probably 95%
of the people buying them), you're going to go for the larger number for
less money, no matter what it actually _means_, since you won't _know_
what it means.

Thanks for your reply. The sound is on all the way, but I didn't wire it to an external amp., the way the doc read it sounded like there was some sort of amplifiers used but evidently not.

Scott

>dollars _more_ just to get the same performance as a Falcon, yet
>the *other* machine is 'competitive'? <even more incredulous look>

When you compare the ST/Falcon software base against the MS-DOG software base, guess who's competitive. PCs rule not because their hardware is better than Mac/Amiga/Atari, but because

(a) IBM licensed the technology so that clones could appear (resulting in a price war feeding frenzy),

(b) Business trusts the IBM name (it didn't hurt that many businesses were already using IBM mainframes),

(c) The open architecture of the IBM platform resulted in a deluge of add-ons. (This was one of the reasons that the Apple][was so popular). True, open architecture can lead to incompatabilities between hardware add ons, but that's the price one pays for an open system.

(d) The "ease of use" of Windoze (I know, I know. Windows really sucks eggs. The Mac/Amiga/Atari GUIs have it beat hands down. However, since most Windows users have never seen the Amiga or Atari GUI, they don't know how terrible Windows is. (Nice marketing, guys).

(e) How many businessmen even know of the existance of the ST/Falcon? They're the ones making the purchasing decisions for companies.

(f) The combined marketing clout of IBM and Microsoft and the low low prices from the price wars between the clone manufactures is an unbeatable one-two punch that is darn near unstoppable.

>[...] The MS-DOS machines appear to be the ones that
>are 'not competitive'.

Hahahahahaha....
Hahahahahaha....

You do live on the same planet?? Atari competitive?? To what??
To musicians, probably yes. To everyone else, no.

> [...] My point: Atari
>is still actively marketing the Falcon.

Actively?? Marketing it where?? Sounds more like Atari delivers the
product to the dealers after eons of delay and expects the masses to buy them.
Somehow Joe/Jane Customer is supposed to know that the Falcon exists?
They're going to intuitively know where to get them? Most people go to
computer stores to buy computers, not music stores.

Of course, the Falcon runs tons of business (yes, BUSINESS) software.
How can the Falcon/ST line help my company? It can't.

Get real!! Atari competitive?? Shesh!!

4475. dodgy mouse?

Newsgroup: comp.sys.atari.st
Date: 1993-09-23 13:24:15 UTC
From: malcolm@minster.york.ac.uk
Message-ID: <748790655.22166@minster.york.ac.uk>
Source record: 200673

My mouse has an annoying habit. When I'm not touching it, it is fine, but if I am holding it steady (i.e. not moving it, apart from the small movements caused by muscle fluctuation) it occasionally causes the pointer to slide at speed across the screen, either horizontally or vertically. There is no problem with large movements, just minute ones.

My system does not include a mouse accelerator. I have swapped the physical mouse (Atari original) with another, and determined that the mouse itself is fine, because it works perfectly on other STs, and mice which work perfectly on other STs display the problem on mine.

I have an original ST (external floppy and PSU), with the 6-chip TOS 1.4. The problem doesn't go away when I boot Developer's TOS 1.4 off floppy.

Does anyone have any ideas? Is it a dodgy port? Virus? How can I fix it?

Thanks,
-malc.

Steven:
I use the Beckemeyer Tools SCSI tape backup program. On their support BBS
there is a TAR program that works great with their tape driver. The backup
program is about $65. I've used it for over a year and have had no problems
with it. I also use the tar program with tapes I make on our HP-720 here at
work and have never had any errors.

rhett> Is it possible to connect an MFM hard drive or an RLL hard
rhett> drive to an ST via the DMA port. I know you can connect SCSI
rhett> drives with the right card, but does such a product exist for
rhett> the aforementioned drive types?

Adaptec makes a SCSI to MFM host adapter, I think, and Omti makes a
SCSI to RLL controller. You can use an ICD or Supra ACSI/DMA to SCSI
and an Adaptec SCSI to MFM or Omti SCSI to RLL and there you have it!
Of course, it would make much more sense to just SELL the MFM drive to
an IBM type person and invest in a SCSI drive and an ICD controller...
grin ICD sells the Omti card if you really want it, though, for
$40ish.

I would reccommend ICD's AdSCSI cards. I have an Advantage, and it
works great... Even after I put + and - 12 volts through where it
wanted +5 and GND and it sparked all over the place, it worked fine.
Any product good enough to stand up to my mishandling is a damn fine
one indeed! And their support people are pretty cool, too.

4489. Questions about MTOS programming conventions.

Newsgroup: comp.sys.atari.st
Date: 1993-09-23 17:07:36 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <27sl4o$8ph@geraldo.cc.utexas.edu>
Source record: 200744
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi,

A beta tester for Ghostscript 2.61 has reported some problems when running under MTOS. Can someone enlighten me about the following issues?

1.) It is apparently conventional for an MTOS application to restore the original color palette whenever another application (or an accessory) is topped. I sort of thought that MTOS would take care of this but I guess not. I suppose I can restore the palette if I receive an AC_OPEN message (what happens if two accessories are opened -- will my program try to resotre the palette again?), but how do I know whether another application has been topped (when my application is running in the background)?

2.) When GS is ready to display an image, it tops the window that the image will be displayed in and then uses the resulting (automatic) redraw message to update the window. This doesn't appear to work properly under MTOS, although it seems to work fine under plain TOS. What apparently happens is that only the window border is drawn by the AES, but no redraw message is sent. Topping the window with the mouse causes only the portions of the window that would have been covered if it had not been topped to be redrawn. This same behavior apparently occurs under TOS when WINX is being used.

Does anyone know what is happening here? Is it bad form for a program to top its own windows under MTOS (is MTOS trying to stop it from happening)?

Thanks for any help.

-Tim

If it is DRI then it should be ok.
HiSoft/Lattice claimed to be able to generate DRI code but that did not work
(belongs to other tools using DRI format, too). Alex ?
A real surprise to me was the ability of the profiler to "understand" gcc code,
is that really DRI format ?

>Do the objects have to be compiled with debug info or not? And what

That does not matter, symbol information is enough.

>can't be done using DRI objects that can be done using Pure ? objects?

Differences are almost alike those between symbolic and source level debuggers.
Add Pure C's fantastic project database (like ctags) to this.

Bye,

Frank

>Otherwise are there any other way to use GDOS programs on the TT?

There is one. :->
But before you search it, try this:
ACSI-DMA ism't possible from TT ram. The Driver allocates the memory it needs in the same ramspace the program does. So, if you set the programflags of your program to 'mallocs from ST-RAM' it might work.

I have a BackPack parallel port tape drive on my mother's 386SX and I was wondering if it is possible to use it to back up my ST's hard drive.

Does anyone know of a program that will let me do this? I don't care about speed as much as the ability to backup my drive. 720K floppies is TOO slow and requires me to be in front of the machine.

Just wondering,
Kenneth Love

4497. Compatibility question

Newsgroup: comp.sys.atari.st
Date: 1993-09-23 18:20:07 UTC
From: rhett@bigwpi.WPI.EDU
Message-ID: <27spcn$s9o@bigboote.WPI.EDU>
Source record: 200651

Is it possible to connect an MFM hard drive or an RLL hard drive to an ST via
the DMA port. I know you can connect SCSI drives with the right card, but does
such a product exist for the aforementioned drive types?
If its just just a simple pin re-routing, does anyone know how?
Any help will be highly appreciated.
thanks
rhett@wpi.wpi.edu

>background)?

Your program will get a WM_UNTOPPED (AES msg number 30) message when one of its windows is "untopped" because some other application or accessory has been topped; this happens only if your program's window was the top window and no longer is.

You'll get either a WM_TOPPED message (if the user deliberately tops your window) or a WM_ONTOP (#31) message (if your window becomes the top one because another window was closed) when your window is (or is supposed to be) topped. The window is already on top by the time you get WM_ONTOP (i.e. do NOT try to force it on top with wind_set).

>2.) When GS is ready to display an image, it tops the window that the
>image will be displayed in and then uses the resulting (automatic)
>redraw message to update the window. This doesn't appear to work
>properly under MTOS, although it seems to work fine under plain TOS.

Why bother doing this? Just call your redraw function directly. This does require that the redraw function walk the window's rectangle list, but that's pretty much necessary anyway even under regular TOS (since redraws can happen while your window is behind an accessory's window). The big advantage of this method is that it gives the user control: if the user was doing something in the foreground (e.g. in a text editor) they may not appreciate having ghostscript's window suddenly pop up on top.

X-oR *used* to have their profiles available as public domain. The profiles written by plain folk (end users) can still be found in the GEnie MIDI/Dr. T's library. But the "official" profiles (written by Bob Melvin, and others who are paid by Dr. T) have to be purchased now.

Yes. Ataris own HD, Megafile 20 contains one of those cards... You can connect two MFM/RLL hard drives to it...

>If its just just a simple pin re-routing, does anyone know how?
~~~~~~~~~~~~~~
NO... Ataris DMA port is a kind of SCSI itself, wich make it *Easy* to connect a SCSI drive. But to connect a MFM or RLL drive you will need a controllercard, ie the one in Atari Megafile, this card converts the MFM/RLL codes into "AtariSCSI".

My system contains of one controllercard from a Atari Megafile 20 and a 70Mb MFM HD plus a 20Mb MFM HD. The only problem I had was to get enough power to the drives...
(*OLD* MFM needs >LOTS< of it...)

You can connect up to 7 controllercards, ASCSI devices, to your Atari, and you can connect 2 HD to each controllercard..... Thats about 14 Hard drives, maximum.... :^D

I don't know the price of a Atari Megafile, it should be sheep!! :^D

>give me some information on this card. US pricing would also be
>appreciated!

Ralf from Cybercube should respond to this. It's his board, and I saw
him on the net a couple of days ago. Hey Ralf, tell everyone about your
board!!

Basically, this board is the be all, end all of graphics cards for the
MegaSTE/TT. You want it, it does it, it supports it.

It also costs $1400 which is why I don't have one. If I used my TT for
serious stuff, I'd have a Cyrel Sunrise without thinking twice about it, but I
don't do serious stuff, so I'll end up with a Nova or Crazy Dots II.

In Germany there are three cards available: The cards by Riebl (about 800 DM), Biodata (about 1300 DM) and PAM (about 1700). There is TCP/IP Software included. For the Riebl card there is are TCP drivers available by anonymous ftp from fortec.tuwien.ac.at. Although the cards from Biodata and PAM are much more expensive I couldn't find any advantage in them compared to the card by Riebl. This card isn't build any more but it is still available. Even Atari Germany sold this cards once.

>And if I could find a card, where could I get the software to run it, and
>how much would the whole mess cost me?

TCP-Software is provided with these cards. If you want to use your TT as X Window Server there is software, too. This software is about 900 DM, depending on your machine and if you want to use color or not. If you need more information you should contact X/software Michael Gehret:

You don't need it. Use 'Save As' in WP and tell it to save as ASCII
text file (I think they call it a 'DOS CR/LF' file). You can then
read this file straight into 1st Word.

The Falcon's DSP would probably not be fast enough to do video stuff,
but things like tuning a guitar would probably be quite possible, and
the filtering out of vocals (karaoke) is something I *know* is already
possible; it's implemented in Compo's MusiCom if I remember correctly.
It can do many funny things to your music, like transforming the
singer's voice to Mickey Mouse in real time. Fun fun fun!

Don't know about DTMF decoding --- I don't even know what that is...

Warhead on the ST is a commercial game by Glyn Williams. It is
not the same as any MS Windows program of the same name. On the
ST it is superb (with slightly jerky lightsourced polygons). On the
Falcon (with a small patch) it is even better (smooths out the
polygon movement nicely)

One of my all time favourite games. Played it until I completed it,
and I still go back to it even now...

Cheers
- Andy.

4521. Screenmodes

Is there any interest in an "FS5" clone for the Falcon, smaller (68030 ASM), more resolutions in up to True Colour (not only 16 as FS5 limits itself to)?

I played with the videoregisters today and found it quite easy to expand the resolutions quite a bit .. (note: I have a normal VGA monitor .. almost ALL VGA monitors can ATLEAST do 768*576 ..)

Some resolutions not found in FS5:

640*480*256 (unknown but VERY fast vertical frequency, will be calculating the exact figures later...)

768*576*256 (VF as above)

320*576*65536 (Can't notice any flicker, my guess is that the VF is quite low though ... shouldn't be noticable with this amount of colours...)

400*480*65536

Well... you get the idea ... you don't need any hardware to get more out of the Falcon than you've already seen ...

(It seems that it's my VGA limiting me to these values ... anyone wanna donate me an SVGA for more testing?)

I haven't written the necessary GEM/VDI patches for this program to work with the desktop etc, and I won't if noone is interested .. so ..

Send me some great Emails if you're interested in a much better screen-enchance for your Falcon .. Software only ...

Well, things aren't always as easy ....

1st Word Plus is really fanzy about the <CR><LF> that WordPerfect
will put in the end of each line.

In other words: You will not be able to *reformat* your text until you
BY HAND (=using DELETE, steady work!) has removed the end of all lines.
This can be done with small texts, but I guess you`re transfering quite
big amounts of data, since you don`t just simply type it in again.

THE SOLUTION:
There are several simple programs, which strips the <CR><LF> from the text.
There should be one at most FTP-sites (look in misc, bin or something like it)
Otherwise I have made such a program to solve excactly that type of troubles
- mail me if U need it.

Sincerly

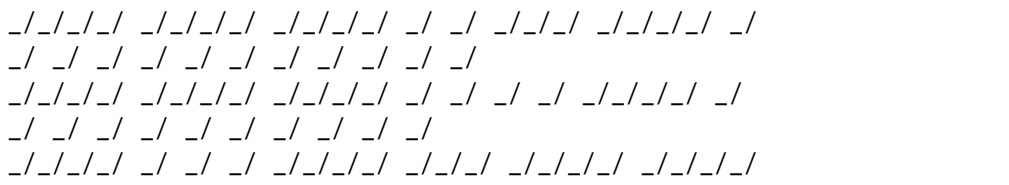
Message-ID: <1993Sep24.115505.27503@solaris.rz.tu-clausthal.de>
Source record: 200692

Hi there!

I wonder if someone knows the difference between the 68881 and 68882 FPU. I plan to buy a FPU for my Falcon030. I know that the 68881 can be put into the Falcon without soldering. Is it possible with the 68882 too? Are these chips pin-compatible?

I want to use the FPU for POVRay. This should give a remarkable speedup...

thanks in advance
Chris



4524. Falcon Audio Hardware Bugs

Newsgroup: comp.sys.atari.st

Hi,
Yesterday I started to use my Audio-Sub-System and
I think it isn't working correct. After a while the left
channel faded away while recording.(I used Winrec 1.3).
Then while play there was a noise in one channel.
My question is now: Which hardware-bugs are known from
the Falcon, and what can I do ???

>Atarians are using for UUCP software?
>
>I have heard a little about Hermes 1.03b, but is it true that
>documentation is only available in German? Are there any other prgms
>that should be looked at that would provide me with a UUCP connection
>at home? I don't have a Dos box, and would prefer to run it on my
>Atari.

I'm using hermes and it is *swell*. in fact, it is so *swell* that I sent
martin his shareware fee. hermes gives you:
email
news
mail based file server
uucp
pathalias
capability to feed other sites
multiple mail boxes
multiple users
and a few other features I haven't figured out because I can't
read german

the latest "offical" release is 1.10 and you can get it from a few FTP sites
around the world or you can get it from my mail server (be kind, I only have a
14.4 modem :-) if I get too many requests, I may limit the file server to
sending out a few requests a day mostly to be kind to my feed site. :-)

As for documentation, 1.10 has more english docs than 1.03, and 1.12 appears
to have more english docs than 1.10. maybe by 1.9999.... all the docs will
be in both languages.

To get information about packages in my (hermes based) file server, send the
message:

help
dir

to server@harvee.billerica.ma.us

I just recieved the disks for hermes 1.12 and I'll be playing with that for
a bit before putting it up on the file server so try again in a month.

Yes, as far as the profiler is concerned, but I never got DRI-object code
generated from Lattice C to work/link with other languages, using CCD Pascal or
Pure C (with DRI-Option), too.

I once completed Warhead up to the Berzerker portion, which I think I could now complete due to all the great advice on the net recently. Thus, I booted up Warhead for the first time in eons, and am embarassed to admit that I cannot get past the black hole. I quadspace to the black hole, get a message saying "Danger, etc." and at that point I either get sucked in, or I quadspace out and fail the mission. I can't remember what I did to get past this before, and all my saved games are gone :-(. Can anyone give me a hint? Thanks in advance.

I was a Flash 1.6 user for a long time, and I am 99.999999% sure that there is no "19200" baud button. This is why I switched to Uniterm. I think there may be some software patches out there that can retro-fit a 19.2k setting into Flash and allow for RTS/CTS flow control. I remember Flash dropping characters at 96k (another reason I switched).

Thus, while the stock Flash 1.6 will work fine on a 96k or 14.4k modem, you could only set the "computer to modem" speed to a max of 96k. This would essentially defeat any performance gain you would get with data compression. With data compressing modems, you set the speed of the "computer to modem" connection to be HIGHER than the base baud rate of the modem. For example, if you have a 96k modem, and you set the "computer to modem" rate at 96k, you will never see any performance increase from the data compression in the modem (all >= 96k modems have data compression).

Here is a picture (assume two 96k modems):

```
19200 9600 19200
[] <----------> [] <---------------> [] <-------------> []
computer A modem A modem b computer B
```

Note that computer A is talking to modem A at 19.2k, and similarly for computer and modem B. Now, the actual transmission speed between modem A and modem B cannot exceed 96k, but this is the _compressed data stream_. When it is uncompressed on either end, it can be spit out at faster than 96k. So, the "computer to modem" speed need to be set higher than the base baud rate

(in this case 9600 baud) for there to be any gain from compression. If everything was set to 9600 baud, there can be no speed gain from compression In fact, you may have problems because data can "back up" at one of the modems. Hardware flow control (also called RTS/CTS) should not allow this to happen, but software flow control (also called Xon/Xoff) can cause this situation.

So, if you are using Flash 1.6 with a 96k or 14.4k modem, you should either upgrade it to accept a 19.2k "computer to modem" rate and use RTS/CTS flow control, or you should get a different program with these capabilities.

My personal choice is Uniterm. I have heard good things about Connect, but I find it to be too slow on my Mega2ST (Warp 9 installed), due to the use of GEM windows. Also, I like the nice big font Uniterm uses (it takes over the entire screen, .TOS style).

4534. Mega 4/GCR System For Sale

Newsgroup: comp.sys.atari.st
Date: 1993-09-24 16:37:12 UTC
From: bmaraldo@watserv1.uwaterloo.ca
Message-ID: <CDvA61.Atx@watserv1.uwaterloo.ca>
Source record: 200607

This is a preliminary message - in the middle of Ocotober I will
be putting my Atari system up for sale. The system includes:

Mega 4 cpu with TOS 1.04, keyboard, mouse, DS drive
115Mb Hard Disk system with two drives (48M and 67M)
Spectre GCR v3.1 w/roms and all software and docs
Mono and or Colour monitor(s) [1224 and 124/5]
Practical Peripherals 2400/9600 external fax modem

Licenced Software includes:
Calamus 1.09N, Tempus II, Word Writer, Mark Williams C/csd, Minix,
STraight Fax, Degas/elite, and some other things that I can't remeber

The hard disk will come formatted with a completly usable desktop and
lots of useful PD stuff loaded. Includes a complete implementation of
TeX and Metafont and all the registered software loaded. Basically,
you will be getting my system, as I have used it over the last couple
of years without my personal files. Also includes about 40M of space
formatted and ready to run with Spectre (in Mac mode).

As for price, I haven't set one yet. But, if you are interested in all or
some of this system please email me with the bits you want and an offer.
As for upper limits (not necessarily what I expect to get):
cpu: $450US, HD: $400US, SPectre: $450US, Mono: $150US, Colour: $200US,
Modem: $120US, Software: $?
Again, these are just upper limits *not* lower limits.

Date: 1993-09-24 16:42:02 UTC
From: hsp4@namaste.cc.columbia.edu
Message-ID: <27v80q$a5j@apakabar.cc.columbia.edu>
Source record: 200603

[stuff about not 1W+ not handling WordPerfect CR/LF deleted]

WordPerfect, at least 5.1, can save files in Ascii with CR/LF ONLY where you place a hard return character. To get it to do this, hit <Ctrl><F5>, and choose option 3 (Save <A>s), then save it as <G>eneric (option 1) text. If you want CR/LF at the end of every line (to preserve the onscreen formatting), hit <Ctrl><F5> then option 1 (Dos <T>ext). <Tab>s carry through in the Generic format as a Tab character (as opposed to being five spaces). Everything else (formatting wise) gets wiped out...

Good luck.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.advocacy

In article <9309231324.AA04596@IBX.COM> zim@IBX.COM
(Bill Zimmer) joins in the fun and writes:
>When you compare the ST/Falcon software base against the MS-DOG software
>base, guess who's competitive.

A) You only need *one* software package for each activity you perform on a computer. Certainly, I'm not going to have twelve different word processors sitting on my hard drive simultaneously -- I'll pick the one I like and forget the others. Atarians can select from several word processors, several spreadsheets, several communications programs, etc.

B) Have you ever tried to actually *purchase* some of this massive software base? Waltz right in to your local CompUSA or Computer City and tell them you'd like a Watcom C compiler for your clone. You'll hear a chorous of "huh?" followed by "there's no such a thing. Wanna Borland C compiler instead?" A massive software base is of exactly zero benefit if you can't acquire it!

C) As soon as alternate software choices are discussed, someone somewhere always blurts out that "if it's not Microsoft Word and Microsoft Excel it's no good and I won't use it." So why bother having a large base of software, anyway?

D) The cost of the software is incredible! For the MS-DOS machines, you can buy WindowsNT for $279.00. On the Atari Falcon (the 4/80 version) MultiTOS is *free*. And if you decide to add MultiTOS to an upgraded Falcon (say, you add a hard drive and memory to a 1/0 Falcon), the upgrade to MultiTOS will only cost half as much, at the most.

E) Have you ever tried the software manufacturer's support service? In the MS-DOS world, you wait forever, and in some cases have to call a 900- number and *pay* them to listen to your problem. I recently had a problem with some Atari software: my letter was immediately answered by the program author, the problem was verified, and a correction issued. (The program even had a "new feature" added that I said would be "nice to have"! WOW!). As a rule, you don't get service *this* good in the world of clones! And naturally, I recommend STalk The Market to anyone who trades in the stock market because of the great support!

Here's my guess: Atari, because there's an application for each
major software activity (word processing, spread sheet, data base,
telecommunications), and because Atari software is cheaper than
the MS-DOS equivalents.

How'd I do? :-)

>PCs rule not because their hardware is better than Mac/Amiga/Atari,
>but because
>
>(a) IBM licensed the technology so that clones could appear (resulting
>in a price war feeding frenzy),

IBM didn't license the technology until after the clones had
forced their withdrawal from the market. (Someone at IBM probably
said, "Hey, they beat us up by using our own architecture! Let's
sue 'em for licensing fees. That'll show 'em, uh-huh.")

The clones appeared because IBM was overcharging for the PC/XT/AT,
and because there was nothing proprietary in the hardware (i.e.,
it was 'easy' to do). It was market forces in action (hooray!),
and the licensing was a belated effort by IBM to turn their
disasterous handling of the Personal Computer line of machines
into a profit. Even today, IBM is only considered to be an
'also ran' when you're discussing personal computers: the big
names are Dell, Compaq, Hewlett-Packard, Epson, etc.

>(b) Business trusts the IBM name (it didn't hurt that many businesses
>were already using IBM mainframes),

Given their recent financial difficulties and first-ever layoffs,
many businesses are casting a wary eye at IBM. Yeah, they'll
continue doing business with IBM, but not as enthusiastically as
in the past, and they'll be open to alternate sources....

[Edits regarding open architecture and the ease of use of
a windowing environment]

>(e) How many businessmen even know of the existance of the ST/Falcon?
>They're the ones making the purchasing decisions for companies.

Atari computers are considered to be business machines in Germany,
and that's where a lot of the business software comes from. ("Big
deal," he says.) Atari is not marketing their computer as a business
machine (although it can be used for business) in the United States --
they're marketing it as a home computer. Different market, different
needs.

>(f) The combined marketing clout of IBM and Microsoft and the low low
>prices from the price wars between the clone manufactures is an unbeatable
>one-two punch that is darn near unstoppable.

Marketing does make the difference, you're right! But I disagree on
the low, low prices of the clones. It takes a $2500.00 '486 running
at 66 MHz to equal the power of the $1500.00 Atari Falcon. As I said:

>>[...] The MS-DOS machines appear to be the ones that are 'not competitive'.

One drawback of the price wars is that 'cheaper' parts are being used
that are more likely to fail. If you upgrade everything in your system
every two years or so, you won't notice the decline in quality. But if
you keep your system for awhile, things will start going wrong. My ST
is 7 years old, and has never been in the shop for repair (not counting
a memory upgrade and a TOS upgrade to 1.4).

>> [...] My point: Atari is still actively marketing the Falcon.
>
>Actively?? Marketing it where??

Just recently, right here in San Diego and Glendale: once to a general
computer faire covering most platforms, and once to an Atari-specific
gathering.

> Sounds more like Atari delivers the
>product to the dealers after eons of delay and expects the masses to buy them.
>Somehow Joe/Jane Customer is supposed to know that the Falcon exists?
>They're going to intuitively know where to get them? Most people go to
>computer stores to buy computers, not music stores.

It's true that the advertising needs to be increased. And it's true
that Atari machines need to be stocked at computer marketing chains
in addition to the existing network of Atari dealers. The limiting
factors are time and money -- but Atari is addressing the need.

>Of course, the Falcon runs tons of business (yes, BUSINESS) software.
>How can the Falcon/ST line help my company? It can't.

Pick up the International TOS Software Catalog ($12.00 at your Atari
dealer, or direct from Atari) and select the software you need. You'll
find a healthy section devoted to business applications (yes, BUSINESS).

I Bought my 1040st just after they first came out with a 20Meg drive
and a color monitor. The only upgrade was the fixed clock (which has
stopped working). I have lots of software (older stuff), but the poor
thing just sits in the corner, way out classed by my 40MHz 486 SVGA...
I'm not very good at getting rid of old computers (I still have a Pet 2001)
especially when the software is still pretty good (quite dated).
Where I am is very little support for the Atari, and I don't
really want to spend to much money to make it a slow Mac, but would
be curious at what software (and TOS chips) I should upgrade it to
to make it more then a simple games machine (preferably something compatible
with the PC)

One use would be with the Roland MIDI Piano. But what is the best software?
What is a good word processor?
Spread Sheet?
What version of TOS?
IS it worth it (I see people selling these things for $400)?

Any ideas, Or is this thing just that outdated?

>Glendale, in a software clearance booth, for 5 bucks.. Help!

Nope, you're screwed.

My copydid exactly the same thing. I brought it back to the store
where I bought it and got another copy. It bombed iin the same place.
(not bombs actually - lock up.)

Looks like they released a buggy game. The first two levels are fun
though, no?

Be happy you only spent $5.00....

Mega 4ST system, and 1040stf For Sale

First, contact details:

Justin DuBois
85 Maywood Ave
Rochester, NY 14618

Ph# (716) 383-0661

Please send E-Mail reply's, do not post reply's, I seldom sift through all the
messages on the netnews.

Internet address:
JAD2433@rit.edu

Mega 4 system includes:

Mega 4 computer with rev 5.0 Motherboard w/4 megs of memory $400 value
HD Floppy controller and 3.5" 1.44meg Floppy Drive

Fast Tech T25 Cache accelerated 25mhz 68000 processor. $375 value
(Software switchable for 8mhz Spectrum compatability)

JRI's 20Mhz 68881 Math FPU, installed on T25 $200 value

JRI's 4096 color shifter for 4096 avaliable colors $49 value

Six Chip TOS 1.4 Atari operating system $50 value
(Two chip TOS 1.2 avaliable)

DEKA-IBM keyboard interface module, and SUNtouch IBM $170 value
compatable keyboard.(Best feeling IBM clone keeboard
I could find) (adaptor $80 keyboard $90)

High quality 64pin Socket installed for the Processor
Manual Overscan switch installed
Manual MultiSync switch and DB9 monitor plug installed
(works great with monitor described below for color and
monichrome support)
Mono Audio out RCA plug installed
Extra Cooling fan above Processor installed
Total value $1224
Discount - %50

Asking price $ 622

Loop, "MultiSync" Monitor
Screen Size 14"
Dot pitch .28
Input Signal TTL and Analog
H-Sync 15~48 Khz
V-Sync 47~100 Hz
Bandwidth 65 Mhz.
Max Resolution 1024*768 Non-interlaced
Front Controls Bright, Cont, Power
Back Controls V-size, H-Add width switch, H-Position, +TTL controls
Focus, and Screen

Value $400
Discount - %35

Asking price $260

Hard Drive

ICD Hard drive controller and Conners 40meg, 3.5" Hard drive in a "ShoeBox"
style external Hard drive case with powersupply. ICD SCSI hard drive controler
with batery backed up clock. Case Includes standard SCSI out plug, and Atari
DMA in and Out ports. Comes with Cables

Drive value $280
ICD Card value $90
Case value $80

Total value $450
Discount - %50

Asking Price $225

Goodies!

Spectre 128 Cartridge with Mac Roms (Mac+ emulator) FIRM $150

MegaTalk Board. FIRM $200
Allows for Mac SCSI interface for use with Mac emulator, as well as two
serial ports for Appletalk and Modem/Printer interface.
When used in Atari Mode, the Serial ports allow HighSpeed interface with the
computer.

Supra 2400 Baud Modem A deal at $45

Atari 1040stf, (working parts computer)
TOS 1.0 Six Chip Set
Socketed 68000
Internal 720k 3.5" floppy drive.
JRI's Sim Slot memory upgrade (currently with 4 256k Simms, upgradeable to 4
1meg simms) I do have 4-1meg simms but I don't know If I want to sell them
yet, I suppose if it will get this computer out of here I'd put them in it.

This computer has everything original except the internal top Shielding, and the plastic case has been cut in half at the seam just behind the keyboard for an earlier experiment.

It works-- $150

---

because I'm so interested in getting it all a out of here in one package, I'm thinking, $1100 and its yours, all of it, plus whatever software I have and all the little bits and peices, cables, Drive Mechanizms etc that take years to collect.

If you take it all off my hands, Ill even cover shipping. Sold seperately,it would be up to you to take care of shipping costs.

My address and phone number are at the top of this page for easy referance.

4543. Re: Ethernet port for a TT ??

Newsgroup: comp.sys.atari.st

Message-ID: <27val1$fjb@eagle.lerc.nasa.gov>
Source record: 200606

>As I understand it, it is possible to put an ethernet card on the VME bus
>on a TT. The question is, where does one get such an ethernet card?
>Computer Shopper has ethernet boards all over the place for Macs or PCs,
>but I can't find anything mentioning VME.
>
>And if I could find a card, where could I get the software to run it, and
>how much would the whole mess cost me?
>

Peter Mayer's group has managed to network their ST and TTs in Austria
using cheap parallel port Ethernet adapters. Our ST and TTs don't have all
the lines of the PC's printer port, of course, but Mayer's group has made
an adapter that routes through the ST's cartridge port so that it then
emulates a PC's parallel port in which the adapter can be plugged in. I
(well, NASA, really) got one early this summer, but have not had the time
to make it work. You can find the writeup and the tcp/ip software on
Peter's location.

Clarence

From pm@sun5.iaee.tuwien.ac.at Fri Mar 19 06:14:33 1993
Date: Fri, 19 Mar 1993 11:36:35 +0100
From: Peter Mayer <pm@sun5.iaee.tuwien.ac.at>
Subject: DE-600

we are using a DE-600-E (Thin coaxial cable connection).
The source and adapter description you found on the ftp server doesn't
use the printer port. Meanwhile we also did some modifications on the
adapter board and the sw to use the BUSY input of the printer port to
get faster response from the network via interrupts, but this is only
needed to increase receiver speed (the BUSY interrupt is only used by
printer spoolers). The sw and adapter works on both our MegaST and TT.
We use networking to connect our STs/TTs to our UNIX workstations and
to FTP files between our Ataris.

Downloaded the enhanced GEM library (e_gem120), the supplied example looked great, just the thing I've been looking for - unfortunately I use Lattice C 5.5 and when I tried to compile it to make the library I got loads of errors. I'm slowly working my way through them fixing them one by one, but it's a lot of work. Didn't realise how incompatible Pure C was to Lattice.

I don't understand the requirement for the mint libs, are they absolutely necessary? I've only got 2MB so I don't use Mint at all. I'm going to try anyway with out linking with the mint libs, see what happens.....

>I think it isn't working correct. After a while the left
>channel faded away while recording.(I used Winrec 1.3).
>Then while play there was a noise in one channel.
>My question is now: Which hardware-bugs are known from
>the Falcon, and what can I do ???
>
> Andreas

It is very unlikely that this is a HARDWARE bug; it is propably just your
1/8 inch input plug at fault. The same problem occours with your walkman
if you wiggle the headphone plug in the socket.

>into Flash and allow for RTS/CTS flow control. I remember Flash dropping
>characters at 96k (another reason I switched).
>
I use Flash 1.6 on my Mega-2 with a USR 14.4k modem. I keep
the baud rate between the ST and the modem set at 19200. I use a patch
for RTS/CTS to keep in on when I enter Flash. And Flash does have a button
for 19200 baud. The only modem program I use that does not support 19200 is
Aladdin which is used with GEnie. It won't do higher than 9600 baud.

The problem with Flash dropping characters at 9600 was probably due to
having RTS/CTS enabled on the modem, but having the ST "unpatched".

The 68882 is up to 1.5 times faster then 68881 :^D

The 68881 and 68882 are pin-compatible, you can, should, put a 68882 FPU into the Falcon 030. 68882 is more made for the 68030 CPU, though you can use 68881 and 68882 with all 680x0.

From: boyd@gauss.math.fsu.edu
Message-ID: <CDvKnJ.K99@mailer.cc.fsu.edu>
Source record: 200620

My understanding is that NVDI is a "software screen accellerator", somewhat
similar to Warp 9 and such. I seem to remember that there are some
fundamental differences as well. My questions are:

1. What does it speed up (everything, VDI calls only, etc.)?
2. Can you install both NVDI and Warp 9? Is this good? Is this stupid?
3. Do I want it for my particular ST (Mega2ST, running TOS 1.2)?

Also, I have seen mention of bugs in Warp 9. I have yet to run into any,
but I don't run MTOS. Is this where the bugs show up?

>on how to avoid compatibility problems? Impressions please...

Erlend, I was fortunate enough to be at the Glendale show when Scott Sanders
of SDS formally announced the Atari Compendium and brought along advance copies
to sell. It is, undoubtedly, the very best and most complete source or
programmer oriented material for the ST/STe/TT/Falcon line of computers that
I have yet seen. It is essentially a rewrite of the previously hideous developer
docs plus a lot of additional material and reference aids, data tables, etc.
It's 840+ pages, softcover, and very nicely printed (IMHO). It is retailing
for $49.95 but would probably cost another $50 to ship to you in The
Netherlands. Hopefully ACN/ST Nieuws will start carrying it.

Yes, I highly recommend the book for all programmer types.

Dear Mrs. Chang,

I just noticed your post regarding an Atari TT Ethernet Adapter from
Austria. Where can I get more information about it ?
Does it come with the necessary software drivers as well ?

We've been producing high end VME-Bus based True Color cards for the
Mega STE and TT030 and we would like to offer our customers the ability
to interface their systems with existing Ethernet nets.

Ralf.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've been using PeaceBug with success on a TT and a MegaSTe, and it works okay on a Falcon030. But when I use FalconScreen for 768x576 mode, the screen of PeaceBug gets totally scrambled! I tried to use the configuration program to set the screen parameters, but the german documentation is of no help to me (a non-german speaker).

Email to FREDDY@ezrz1.vmsmail.ethz.ch bounces. Does anyone know where Emanuel Moecklin has gone to?

Or has anyone managed to get PeaceBug to work together with FalconScreen in the 768x576 16 color mode?

-Dan

Yes, you can profile programs with DRI symbols, but you won't see the
C (or Pascal) source. Compile and link with symbol switched on (some
compilers allow to retain the local symbols, too).

With Pure C object files, you'll see the C source and you'll have longer
symbols (up to 255, I think).

4560. The Atari Jaguar News...

Now for somthing you will really like! The latest Jaguar News!
The October issue of EGM has pictures of the Jaguar and even the
box too!! Check out the October 93 issue of EGM for the one page
look at the Jaguar. EGM was not really impressed by the two games
they played...

09/24 1103 Atari announces Jaguar Developers

SUNNYVALE, CALIF. (SEPT. 24) BUSINESS WIRE - Atari Corp. (AMEX:ATC) Friday
announced its initial list of developers for the Atari Jaguar 64-bit
Interactive Multimedia system.
Since July, 20 developers have signed license agreements to publish game
titles for Jaguar. Additional high-profile developers and publishers are
expected to be announced in the coming weeks.
"Developer response to Jaguar has been overwhelming -- we've accomplished
what we set out to do by attracting the industry's top developers," said Sam
Tramiel, president of Atari. "The tremendous power of Jaguar removes the
programming barriers that exist on all other gaming platforms, allowing
developers to focus their energy and imagination on creating truly
revolutionary video games. The technological prowess of our developers
coupled with Atari's aggressive marketing and comprehensive developer support
program will create a new industry standard for multimedia performance."
The developer list includes:

Anco Software Ltd. Maxis Software Telegames Beyond Games Inc.
Microids Tiertex Ltd. Dimension Technologies
Midnight Software Inc. Titus Eurosoft Ocean Software Ltd.
Tradewest High Voltage Software Rebellion Software Ltd.
Trimark Interactive Krisalis Software Ltd. Retour 2048
U.S. Gold Ltd. Loriciel S.A. Silmarils

The strength of the Jaguar platform has attracted the industry's premier
developers, allowing them to immediately begin programming the industry's
first 64-bit video games. Comments include:
"We're excited about the reality of an advanced video game system retailing
for approximately $200 and delivering technology comparable or superior to
announced systems costing over three times as much. Atari pioneered the video
game industry -- it's good to see them at the forefront of innovation once
again." -- Kelly Flock, executive vice president of Trimark Interactive
"Kids, don't waste your Christmas money on something else, this Cat is the
new king of the video game jungle." -- Terry Grantham, president of Telegames
Inc. (Telegames will release "Ultimate Brain Games" and "European Soccer
Challenge" for Jaguar in the spring and summer of 1994.
"The 64-bit power of the Atari Jaguar allows us to move light years beyond

today's game standards." -- Kris N. Johnson, president of Beyond Games Inc. (Beyond will release "Battlewheels" for Jaguar in the second quarter of 1994.)

The power of the Jaguar development environment allows programmers to:

-- Create the industry's first 64-bit video games
-- Deliver unprecedented true-color graphics, stereo CD-quality sound and animation speed
-- Enjoy unsurpassed ease in creating real-time 3-D virtual worlds
-- Unleash programming creativity previously hampered by the restrictions of all other gaming platforms

Atari Corp. manufactures and markets video games and personal computers for the home, office, and educational marketplaces. The Sunnyvale-based company manufactures Jaguar products in the United States and is publicly traded on the American Stock Exchange under the symbol ATC.

09/23 1023 Atari appoints new director of marketing/advertising

SUNNYVALE, CALIF. (SEPT. 23) BUSINESS WIRE - Atari Computer Corp. announced Thursday that Terrence Valeski, a 22-year veteran in consumer electronics marketing, has joined the company as director of marketing and advertising for Jaguar.
Valeski's immediate responsibility will be to execute the national roll out for Jaguar -- Atari's new high performance gaming system. He reports directly to Sam Tramiel, president of Atari.
"We are very pleased that Terry has joined Atari. His experience is invaluable to us," said Tramiel. "Developing strong relationships with retailers and developers as well as communicating with consumers will be critical to our success as we get ready to market and distribute Jaguar world-wide."
In an industry dominated by foreign companies, U.S.-based Atari announced this summer that it has developed a high-performance, 64-bit home video game system called Jaguar, capable of delivering faster and more powerful video games to the home market. Atari will be made in America and has signed IBM to manufacture the Jaguar in its Charlotte, N.C. plant.
"Jaguar has truly leaped ahead of the competition in terms of quality, price and performance," said Valeski. "My job will be to ensure that we attract the best and the brightest and to market aggressively through the channels of distribution. You can expect to see some major shifts in the way Atari markets." Jaguar is expected to be available to consumers before Thanksgiving 1993.
In an effort to develop strong marketing programs, Atari recently chose Cunningham Communication Inc. as its marketing/communications counsel. Cunningham is a Santa Clara, California-based public relations firm specializing in high technology.
Before joining Atari, Valeski was founder and chief executive officer of Intellivision, a leading home video game manufacturer in the 1980s. Prior to

that he was senior vice president for the Mattel Electronics division of Mattel Toys. Valeski also held several senior positions at Teledyne Waterpik and J. Walter Thompson Advertising, San Francisco and New York. -0-

The easiest solution may be to upgrade to Opus 2.31 -- I have it and I'm pretty sure it's still the latest version.

Yeah, this is likely. I heard about the patch after I had switched to
Uniterm, so I never tried it. Uniterm is a lot nicer than Flash in many
ways. However, I still like the way Flash handles its scrollback buffer
(one mouse click, and you are in a GEM window looking at the scrollback).

Hmmm, I already posted this once, but it seems to have been eaten by the
News diety. Here we go again . . .

I was wrong. There is a 19.2k setting for Flash. However, there is not
a way to set RTS/CTS flow control, so it drops characters at high speeds.
This prompted my upgrade to Uniterm. Now, there exists a software patch to
fix this.

Glad I left myself that 0.0000001% :-).

> ~~~~~~

Yes sure, here is the address I used: ftp.cs.tu-berlin.de
e_gem is held in Programming as far as
I remember. One thing though, this site
is very slow, it took me a couple of goes before
I got in.

I've been trying to get e_gem120 to work today using Lattice 5.5. And
I've just finally done it - at least I've managed to recompile the
example. Here are some hints if you need them. I junked the OBJECT,
TEDINFO etc definitions from the Lattice distribution and used instead
the PureC compatible ones that come with gemfast.h in GNU. This saved a
lot of work. Also the cdecl pre-function switch is not quite right
and should be `__stdargs __saveds', this is used in the user defined
OBJECTS, eg draw_menu in dial.c *must* be changed in this way. Make
sure stack checking is off and use short as default. I used the
supplied makefile.lcc to make the library under Gulam, then used the
Bench shell to do the rest. The supplied PRJ file is ok except that
Lattice thinks that the program should have no start up code, this got
me for an hour or so before I realised, use standard program startup.
If you want the program to be an ACC and PRG then you must alter the
_app varaible, for the moment I just commented them out but presumably

one would use xmode with Lattice. There might be some other things I have forgotten to mention, if I could do it in a day then most people who use C a lot will have not problem.

Next thing is to explore what the library can do - what I really need is a library implementation of scrollable boxes eg like on the file selector, it might have it since a help screen is implemented in this way in the example.

Good luck
Herbert Sauro

I'm curious about how to write a complete application with E_GEM 1.20 because I'm not sure what the conventions are that the author is using. I guess I'll be pouring over the sources to the libs, but if possible, I'd like to see if there is some English docs for it (i tried using the GER2ENG program and it only helped a little bit...)

The only bad thing about E_GEM is that I wanted to see if I could integrate it with GEM++, but GEM++ seems to only work if I don't use -mshort and E_GEM only works when I use -mshort under GNU C.

4573. Stereo to Falcon

Newsgroup: comp.sys.atari.st

kendall@flammulated.owlnet.rice.edu (Kendall Helmstetter Gelner)wrote:

>Whenever I hook up a stereo cable between my Falcon and the headphone
>jacks on my stereo, all I get is a horrible HUM from the Falcon, and
>garbage.....

The problem is due to the large mismatch in signal level and impedence
between the stereo output and the Falcon mic input. A microphone
has an output level of approximately -50 db, while the headphone output
from the stereo is much greater than 0 db.

The solution is to use the line output from the stereo with an attenuator
made up of a few resistors inserted between the stereo output and the mic
input. The following 'T-pad' resistor network, one in each channel, should
make it work:

```
in---zzz---+---zzz---out
560 | 560
z
from stereo z 3.9 to mic input
z
|
in---------+---------out
```

--zzz-- is a resistor values are in ohms

If you must use the headphone output from the stereo, change the resistor
in the 'in' side to 3.9 ohms and adjust the value of the resistor in the
'out' side to give the proper Falcon input level with the stereo's volume
control near the middle of it's range.

>VDI. Now, don't tell me you'd rather do your word processing in true color
>mode! :-)

Not a chance. However, the reason you might want to run in 256
colour mode would be that it's real nice not to have to put up with
rebooting or resetting resolutions for every application you want to
run, especially if you are running several applications. The Falcon I
had here took at least as long to change resolutions as my mega used to
take to change from mono to color. I thought Atari was going to get rid
of that?
Also, regarding nvdi, much as I was a fan of it on my mega, the
numbers didn't look all that impressive for the new Falcon version, at
least the numbers for 256 colour mode posted a few months ago from their
first Falcon release. Have they managed to do better now?

Does anyone know of any program that splits/reassembles files in gem?
Something that works like unix command "cat" is what I'm shooting for...
Thanks for the time.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have another strange problem with my falcon - a number of programs seem to not work with the DSP!! If I run Audio Fun Machine, Winrec, or the DSP fractal generator, they cant use the DSP (AFM says "Cannot Load DSP code", or something similar).

However, the D2D recorder and SAM and Speeder (which I belive uses the DSP chip to do scaling and rotation) all work OK, although D2D does sometimes complain that it has to reset the DSP to work.

So, what could be wrong? All of this stuff worked just s little while ago...

As always, any help is appreciated!!

Thanks,

E>I'm slowly working my way through them fixing them one by one, but it's
E>a lot of work. Didn't realise how incompatible Pure C was to Lattice.

If you're using the MiNT-library, there should ;-) be no problem...

E>I don't understand the requirement for the mint libs, are they
E>absolutely necessary?

If you're using Lattice, they are necessary (for the moment). There are so
many differences between Lattice- and MiNT-/Pure-libraries that it would take
lots of time to fix it.

E>I've only got 2MB so I don't use Mint at all.

Ups... you don't have to use MiNT if you want to use the MiNT-libraries! The
name of the game is caused to the fact that the library supports MiNT...

E>I'm going to try anyway with out linking with the mint libs, see what
E>happens.....

Good luck! ;-)

Regards,
Criss...

I dont know if its the same problem, but when I run, say WinRec,
exit, and then try to run AFM, or anything else, my machine crashes.
AFM says the same thing, but still crashes. I then reboot, and all is
well.
Of course, thats an ulgy fix, and it seems that perhaps the DSP
is not being released properly? Since it shows up in all the DSP stuff
I have, I would have to assume its a bug from Atari...

I've used my Falcon w/TOS 4.01 for six months now and never noticed any serious bugs. What's wrong with it?

I would wait for TOS 5 though, before I upgrade. It will be a MAJOR improvement!

This is not a flame but it's beyond me why anyone would want to run a standard (no gfx) word processor in 256 color mode. Yes, I agree the PC is faster, until you add NVDI to your Falcon. To bad it's not shipped by Atari as the standard VDI. Now, don't tell me you'd rather do your word processing in true color mode! :-)

> I think Atari has screwed up big time by not offering a faster

On this we agree totally. I too would want a "power" Falcon with a real keyboard and plenty of room for 3rd party expansion boards!

>redraw message to update the window. This doesn't appear to work
>properly under MTOS, although it seems to work fine under plain TOS.
...
>This same behavior apparently occurs under TOS when WINX is being used.

MultiTOS and WINX use smart REDRAW. This means that the window manager sends
only WM_REDRAW messages for dirty portions.

You can switch of this feature of WINX. Add a line like the following in
WINX.INF (PRGNAME without path and extension):

PRGNAME = 4-

Unfortunately MultiTOS no longer merges WM_REDRAW message. So it's not possible
to give you a simple solution.

cu, Martin

In case others don't know, one can check the version of Dungeon Master by
looking at the load/save game dialog. It is at the written at the top.

>Atari.

This comes up a lot, so perhaps it should be in the FAQ (or is it? I
confess I haven't looked recently.)

UUCP for the ATARI ST...a summary. Additions welcome!

Plusses and minuses are of course mine own opinions. Yours may differ.

Hermes -- probably the most popular, mail and news. Shareware.
Plusses - nice GEM interface, popular. Lots of people to help
you with it, still actively supported.
Minuses - Some people have problems with it under MiNT, the
uucico it uses doesn't handle login sequences of more
than two strings, documentation is still primarily in
German. If you don't read German, you can get it
going, but you'll probably miss some of the nice
features (scheduling & so on).

Mercury -- ancestor to Hermes. Technically shareware (I say that since
I think I saw a note from Rodney saying he didn't care about
Mercury any more, talk to Martin. This may be incorrect.)
Plusses - emulates UNIX rn & elm, so reduced culture shock
switching between them. Both binaries and source
available from the comp.sources.atari.st e-mail
server. More English documentation available. Useful
as a training ground before you move onto Hermes :-)
Minuses - uses the same uucico [family] as Hermes; same problems
with login sequences & MiNT.

Mailtruk -- GFA Basic code for a uucico by John Logajan, available from
atari.archive and (I think) comp.sources.atari.st. Mostly
mentioned for completeness, except that it formed the basis
for the uucico mentioned above and for bauble (below).
Plusses - source available.
Minuses - old, has been superseded by a number of versions.
Not actively supported. Not a bad starting place for

figuring out the uucico 'g' protocol, though.

Bauble -- MiNT-aware uucico & quick'n'dirty mail reader by david 'orc'
parsons, originally intended for STadel BBS.
Plusses - source available from comp.sources.atari.st, reliable,
arbitrary login sequences handled, source is in C,
quite reliable (I use this one)
Minuses - no news, you need orc's personal libraries to compile
source (unless someone converts it to mintlibs). I
have orc's permission to mail these to people, so you
can try it.

Taylor UUCP -- port of Taylor UUCP to MiNT systems. Large.
Plusses - Taylor UUCP is quite sturdy, uucico is robust.
Source mostly available.
Minuses - Supporting features like smail & news software are
still experimental.

Beckemeyer Tools UUCP -- Reasonably faithful BDT implementation of
version 2 UUCP for BDT's multi-tasking C-shell.
Plusses - Looks pretty faithful. I have a very old version,
so I can't comment on the current state of the
software. Commercial, so you can get support.
Minuses - The old manual was pretty skimpy. Could be much
better now, though.

Permission granted to amend, extend, and reproduce, including in FAQs.

Yeah, and how long did PC users wait for a version of OS/2 that did
what it was supposed to do? I remember reading about it back in 1987.
I knew people who needed a true 32 bit multitasking OS on their PC for
a project. Needless to say, they were forced to give up on the PC
because Microsoft never could deliver.

> (ftp preferably) and I'll download it myself!

It's available on GEnie, and possibly atari.archive.umich.edu; if not,
I'll upload it, it's quite nice... You can set it so that 1 cm moved on
the mouse pad is 1 cm moved on screen...

> C>I've also found that I can load more than one ACC (as long as I don't
> C>try to use XControl) under MiNT if I load The Chameleon as well.

I don't use it, I just have to load it; then I can have TOSWIN and
BeforeDawn both loaded. Very strange, but it's the only way I've been
able to load more than one ACC under MiNT 1.08; I can't load XControl at
all (and this is TOS 1.4, so it should be ok!)...

What kind of spport is out there for the Falcon? I used an Atari ST some six years ago and loved the machine, but hated the lack of support. I may look into the purchase of a Falcon if the support factor is large enough to justify the purchase.

This is, IMHO, such a load of crap. WHY would Atari use such a stupid,
proprietary scheme when there are zillions of PD/SW Adobe Type-1 fonts
available, and Adobe seems quite happy to lisence their stuff to anyone?

It doesn't make any sense to me at all (but then again, I've spent the
past several years collecting about 22M of type-1 fonts)... A company
in this sort of state (their financial state and the lack-of-users)
shouldn't be pulling this sort of stupid move.

Some programs don't seem to be 'smart' enough to reconfigure the sound
system if SAM is installed. If you remove SAM or at least disable
system sounds, the other programs should work fine. At least, this
is what it took to work on my Falcon.

RandyH

4621. Combination Gemini & HSC bombs

Newsgroup: comp.sys.atari.st

Thanks for the plug :-) Guitaristics and Pianistics are not exactly new products. They are programs that have been ongoing projects for the past 6 years with continual updates and revisions. Guitaristics is currently at version 1.96 and Pianistics is at version 1.20 - both work on the Falcon030 as well as all other versions of the ST. Look for a new version of Pianistics to be released sometime in January (hopefully in time for NAMM) and a new version of Guitaristics sometime after that.

There are disabled demo versions of the software available on Delphi, GEnie, and our support bbs (+1-417-624-1887 / 24 hours / usr dual).

I know that there is a mirror of wuarchive on archie.au (plaza.aarnet)
but I can't remember the path to get there. The index files lying
around on archie are fairly unhelpful too. Anyone know where I should
be looking?

Thanks,

Jared

Things have not changed at Atari from the situation six years ago, other than to have gotten worse.

Atari is now giving its full attention to its new game machine, the one year old Falcon is getting very little support from Atari, and barely more than that from anyone else.

My sentiments exactly. Many of the screen savers don't even work on
my TT anyway. Warp-9 doesn't work with MultiTOS (or more importantly
to me, with the current MiNT).

Maybe the problem is just what I suspected when I bought Warp-9: they
aren't debugging Darek's code, just adding more pretty stuff to try to
increase sales.

Wake up & smell the coffee Bob. Atari may well be doing their usual stuff but 3rd
party support for the Falcon is good and growing. I know though that no matter how
much people tell you the reality of the matter, you prefer to ignore it and winge.

> How 'bout telling us what FSP is? What's the "S"?
>
FSP is the "File slurping protocol", which is similar in function to ftp, but it goes via UDP and not TCP; normally the sending host does not have to support it with so much computing power like for ftp.

Regards,
Ulrich

p.s.: To the original poster: try wuarchive.wustl.edu via fsp, there should be somewhere a list of hosts around.

Just thought I'd stick my oar in on this one :-)

At home I have many old "home" machines from ZX-81s up to a MEGA2 ST.

Now I know it's a bit old, but it has _none_ of the upgradeable potential of most of the all of the PCs I have available at work - and some of them are older. I could get a SVGA graphics card for 80 UK pounds or 800 UK pounds, hard drives from about 150 UK pounds up to thousands. I can't even get hold of firms very easily to upgrade my ST hardware!

Someone also mentioned WindowsNT being expensive compared with the GEM on the ST (or MultiTOS). However, remember that to get Windows (Not NT) is about the same cost as an upgrade to MultiTOS for my machine!

Nowadays PCs come with an upgradeable motherboard, and you can mix and match components to suit your needs - a big disk, good graphics, fast processor or whatever. That is why the PC is so popular: You can buy a cheap one for games at home or a really fancy one for work.

So where do I get a 256 colour graphics card for a MEGA2 (not STE) for less than 100 UK pounds...or do I save up for a PC? :-}

These ramblings are mine - all mine
Little John

|> bugs. What's wrong with it?
It handles 3d GEM badly. This mainly shows on stuff with cascading menus ie they don't. Lattice C uses these a lot. You can only use this properly by running MTOS which has fixed AES code in it. In fact, If you use MTOS and fpatch2, 4.01 is pretty much fine.

Hi,

there seems to be a problem in MfsfM 1.07d with the mfsfm.cnf file.
Some users told me that the system hangs up completly if they call
MfsfM for the first time. This problem is pretty easy to solve. Copy
the file MFSFM.CNF from the distribution in the root of one of your
drives e.g. C:\. There will be no longer problems with this.

Regards,

Marcus

Atari's HDX will allow you to boot directly from the drive. So will ICD's PRO utilities (though they're commercial). However, your drive also must be capable of autobooting to begin with...

The Speedo font engine is faster and uses less memory (as compared to the available PS engines).

4651. kid software on atari.archive.umich.edu

Newsgroup: comp.sys.atari.st
Date: 1993-09-27 13:05:55 UTC
From: meulenbr@prl.philips.nl
Message-ID: <meulenbr.749135155@cstw168>
Source record: 200471

Hi,

About a year ago I retrieved the kidprogs subdirectory from
atari.archive.umich.edu.

However, several of these did not run on either my ST or TT.
kv_me1st, kv_fonic and kv_geo1 did run. Unfortunately kv_fonic is not
too interesting since the native language of my kids is dutch. kv_geo1
is just too difficult for 4 year olds.

Does anyone have running versions from either
potato, kv_house, kidsong1 and kidmixup?

Also if someone happens to have other sequences for kv_me1st, or if
someone has the programs kv_park_ or kv_match (which are mentioned in
the doc of a kv_ archive, but which are not available on
atari.archive.umich.edu), I would appreciate a copy (or a pointer to
where I can get them).

Of course other pointers to software suitable for 4 year old children is
also appreciated.

Thanks,

A faster engine doesn't make up for no "gas". What's the point of having a
font engine which doesn't have any readily available fonts?

(I know there are *some* Speedo packs out there, but why not go for the
standard and do it right in the first place??)

Help! I cannot get Ishar 2 to work on my hard disk (Stacey). It
works fine from floppies - but the disk access is a pain in the port -
and I can copy it onto the HD, and even get through the intro.
Then it checks the copy protection on the floppy, and sticks,
announcing a hard disk error (the HD is fine).
Any clever ideas?

tia, Mike

>What did you have to leave out?

Here's the end of the config.h that was used to make the binary:

/* game features */
/* #define POLYSELF /* Polymorph self code by Ken Arromdee */
#define SOUNDS /* Add more life to the dungeon */
/* dungeon features */
/* #define SINKS /* Kitchen sinks - Janet Walz */
/* dungeon levels */
/* #define WALLIFIED_MAZE /* Fancy mazes - Jean-Christophe Collet */
/* #define REINCARNATION /* Special Rogue-like levels */
/* monsters & objects */
#define KOPS /* Keystone Kops by Scott R. Turner */
#define ARMY /* Soldiers, barracks by Steve Creps */
/* #define SEDUCE /* Succubi/incubi seduction, by KAA, suggested by IM */
/* #define WALKIES /* Leash code by M. Stephenson */
/* #define TOURIST /* Tourist players with cameras and Hawaiian shirts */
/* #define TUTTI_FRUTTI /* fruit option as in Rogue, but which works, by KAA */
#define MUSE /* Let monsters use more things - KAA */
#define MULDGN /* Multi-branch dungeons MRS & IM */
/* difficulty */
#define ELBERETH /* Engraving the E-word repels monsters */
/* #define EXPLORE_MODE /* Allow non-scoring play with additional powers */
/* I/O */
/* #define REDO /* support for redoing last command - DGK */
#define COM_COMPL /* Command line completion by John S. Bien */
#if !defined(AMIGA) && !defined(MAC)
# define CLIPPING /* allow smaller screens -- ERS */
#endif

#ifdef REDO
# define DOAGAIN '\001' /* ^A, the "redo" key used in cmd.c and getline.c */
```

```
#endif

#define EXP_ON_BOTL /* Show experience on bottom line */
/* #define SCORE_ON_BOTL /* added by Gary Erickson (erickson@ucivax) */

#include "global.h" /* Define everything else according to choices above */

#endif /* CONFIG_H */
```

The hardest thing to sacrifice was the Tourist code, but this is
probably inevitable, as it accounts for a major reduction in the code
size.

The first issue of Warp-9 did not work with CAD 3D just as Quick ST did
not work with CAD 3D. However, the next upgrade did, and they sent
me that upgrade ($5? $10?). So at least that portion of the code was
improved. I'm not interested in screen-savers so I haven't upgraded since.

>do this (pine?) would be also welcome.

Well, I read your posting, ftp'ed the newest version of elm (2.4 PL22) and
compiled it with no greater problems on my TT... :-)

If there is some interest, I can upload it on some ftp-servers.
MiNT and Minix FS are required because I didn't change any filenames.

PS: trn is also running on my Atari! Interested?

Greetings,
Benni

4660. Areal 90-260MB 2.5" drives--Specs...

Newsgroup: comp.sys.atari.st
Date: 1993-09-27 16:18:29 UTC
From: x91mikowski@gw.wmich.edu
Message-ID: <1993Sep27.111829.11540@gw.wmich.edu>
Source record: 200478

Hi!
There was a question about specifications on Areal 2.5" drives, so here's
a post about those specs--sorry, I don't have prices...

Model: A90 A95 A120 A130 A135 A180 A260

Size: 91.5MB 91.5MB 137MB 130MB 130MB 183MB 260MB
Height: 12.4mm 10.5mm 15.5mm 12.4mm 10.5mm 15.5mm 15mm
Width: 69.9mm 69.9mm 69.9mm 69.9mm 69.9mm 69.9mm 69.9mm
Depth: 87.6mm 87.6mm 87.6mm 87.6mm 87.6mm 87.6mm 87.6mm
Access
Time: <15ms <15ms <15ms <15ms <15ms <15ms <15ms
MTBF: ALL 100,000 HOURS
RPMs: ALL 2981 RPM
Data
Rate: 15Mbps 16-30Mbps 15Mbps 16-30 16-30 15Mbps 16-30Mbps
Power: ALL 5VDC +/- 10%
Max Wattage: ALL 4.00W DURING SPIN-UP

I have more spec's but I thought that these would be the ones most
people would be interested in. According to the sales rep when I called
a couple of months ago, these were available on the west coast and from some
mail-order companies. Anyone want to try putting an A260 in their Falcon?

See ya,

Bernard

4661. Re: Atari Compendium question

Newsgroup: comp.sys.atari.st
Date: 1993-09-27 16:33:38 UTC
From: erkamp@titan.arc.ab.ca
Message-ID: <1993Sep27.103339.1407@janus.arc.ab.ca>
Source record: 200379

In article <CDunyE.L7E@barclays.co.uk>, Iain.Laskey@barclays.co.uk writes:
>I've never heard of 'Atari Compendium'. Can you provide mor einfo?
>

Here is something on it I got off a local BBS. I am not responsible for the content:

```
==========================================================================
FOR IMMEDIATE RELEASE
==========================================================================
SOFTWARE DEVELOPMENT SYSTEMS
...is proud to announce...
THE ATARI(tm) COMPENDIUM
==========================================================================
```

Software Development Systems will debut "The Atari(tm) Compendium" at the Southern California Atari Computer Faire v7.0, Saturday and Sunday, September 18th and 19th at the Glendale Civic Auditorium.

Both professional and amateur programmers will find the Compendium the single most valuable reference ever published for Atari computers. The Compendium contains 860 pages of documentation, tables, and diagrams galore. A table of contents follows:

```
TABLE OF CONTENTS
=================

Chapter 1: Introduction to Atari Programming
Chapter 2: GEMDOS
Chapter 3: BIOS
Chapter 4: XBIOS
Chapter 5: Hardware
Chapter 6: AES
Chapter 7: VDI
Chapter 8: Line-A
Chapter 9: Desktop
Chapter 10: XCONTROL
Chapter 11: GEM User Interface Guidelines
Appendix A: Functions by Opcode
Appendix B: Memory Map
Appendix C: Native File Formats
Appendix D: Error Codes
Appendix E: ASCII Table
Appendix F: IKBD Scan Codes
Appendix G: Speedo(tm) Fonts
Appendix H: The Drag & Drop Protocol
```

Contained in the appropriate chapters are complete function references for each Atari system call in an easy-to-read format. The function reference in the Compendium is up-to-date as of MultiTOS 1.08b and TOS 5.0.

Some highlights of topics covered are:

- The TOS file system
- Networking
- GEMDOS/MiNT processes
- MiNT interprocess communication
- The Cookie Jar
- BIOS/XBIOS/GEMDOS Vectors
- Falcon030 Video/Sound Control
- The DSP
- The IKBD Controller
- Utilizing math coprocessors
- Game controllers
- Resources (including new TOS 4.0 resources)
- Window iconification
- VDI Workstations
- True-Color device graphics
- SpeedoGDOS
- Desktop extensibility
- Extensive user interface guidelines
- The most complete memory map ever published
- A complete "graphic" catalog of Speedo characters
- File formats (.GEM, .IMG (including color), .FNT, .RSC)

Programmers using 'C', 'C++', 'Pascal', 'Assembler', or 'BASIC' will all find useful information contained in the Compendium. Each function call is listed with a binding (in 'C' or Assembler as appropriate). In addition, each function reference includes a 'Caveats' section which notes system bugs and which OS version they appear in (and a fix if possible).

The Compendium is professionally bound with a four-color cover in standard 7"x9" format.

The Compendium will be available at your local dealer shortly after its debut at the show and will also be available direct from SDS at the address listed below.

Product Name: The Atari Compendium
ISBN: 0-9638331-0-3

Suggested Retail Price: $49.95

When placing an order with SDS directly please send a check or money order for $49.95 and $4.00 shipping and handling. CA residents add 8.25% sales tax. We accept international orders with international money order only. International customers should add an additional $2.00 S & H.

We are sorry but we cannot accept credit cards.

Opus is a very good one...it has a very good graphing facility (using
GDOS), and I think it will read/write text files. Unfortunately, I find
the entry method to be a pain if you're used to Lotus-style entry...you
have to tell Opus what kind of data you're entering, but I suppose you
could get used to it.

I'm told the latest version is 2.31.

: >>: the next release...
: >>That seems to be the story of every Atari users life....and wait...and wait...
: >>and wait...

: >And how long have the MS-DOS users been waiting for WindowsNT?

: Yeah, and how long did PC users wait for a version of OS/2 that did
: what it was supposed to do? I remember reading about it back in 1987.
: I knew people who needed a true 32 bit multitasking OS on their PC for
: a project. Needless to say, they were forced to give up on the PC
: because Microsoft never could deliver.

Fortunately, those days are long over. PC users have numerous
choices for 32-bit operating systems, in spite of Msoft trying
to keep them in the dark ages. Linux+X is one of my personal
favorites, though you can also get Nextstep, OS/2, NT (gak..),
and lots of other flavors of Unix.

Let's see how much of a choice the Atari world will have. I
still don't think the Falcon will ever catch on so I will be
very surprised to see other 32-bit multitasking OS's for it.
Geneva sounds very interesting though.

Cheers,

Chris

If you want the Falcon to boot from disk _only_, first you should cold boot your machine (CTRL-ALT-rightSHIFT-DEL). When the Atari logo appears, the drive LED flashes once, then the Falcon is doing a memory test. After that, the drive LED is turned on once again. This is the time to _hold down_ the ALTERNATE key. Hold it down until the desktop appears or your game begins to load. Now the hard disk is skipped completely.

Not all versions of Dungeon Master will run on the Falcon. AFAIK, v1.2 will run o.k.

IMHO Dungeon Master is still the best computer roleplaying game.

Pure C is sold by Gribnif, and costs $275. And yes, I think the program
has not been translated, but you should be able to get by with a good
German/English dictionary.

Another option that I just discovered is msdos.archive.umich.edu.
This gets you into the same archive but through a different machine.
I have never had a problem with this. Once you're in just access
everything like you would on atari.archive.umich.edu.

K>The subject line says it all. Is it possible to boot from the
K>autofolder of the floppy in yer Falcon? I really want to play CSB and
K>Dungeon master, and a few others. The Falcon sees bootsectors and (
K>tries to) boot them, but them autoboots the HD in the Falcon. Am I
K>missing something here?
Yeah, i would say so.
Try pressing <ALT> before the Atari HD-driver is loaded, and your Falcon should
boot from drive a:. PS: playing Dungeon Master on the Falcon is a bit faster!!!

Ciao,
Carsten

> Load DSP code", or something similar).

Have you dragged them to the desktop? If so, you should set default path to "Application" in desktop menu "Install Application"...could be it... Otherwise it might be that a program running before exited still having "locked" the DSP or something like that (That's why D2D complains I think), try running D2D first and then run the problem-program again...

Well, I'm very far from being an expert but it might help...I haven't experienced any of the problems except D2D:s complaining...

>appreciated!

I'm one of those guys who would agree with that dealer. I had a
chance to see it in action at the Glendale Atari faire and I've been
regretting my decision to buy my NOVA ever since (of course, at the time I
bought it, it was a good deal but such is hindsight).
One thing to remember is that the Cyrel is the best, _not_ the
cheapest. At the Show it was on special for $1000, normal Retail was
$1500. However, it supports 800x600x_32bit_ (not just 24bit like the
NOVA), it was _much_ faster in all resolutions (it has something like
twice the pixel clock of the NOVA...128MHz sounds right) and it had the
ability to intercept calls to the hardware so that most software that is
not "video expansion aware" worked fine in the TT or ST compatibility
modes. Also, unlike the NOVA, the Cyrel is all on the VME card, whereas
the NOVA is a VME adapter to a black box containing was is esentially a
ATI 24-bit graphics card.

That being said, the NOVA is still a good card. In most
resolutions, it is faster than the built-in video of a TT. It is pretty
solid in coping with other software. The only slowness I have ever
noticed is when redrawing large 24 or 16 bit graphics. A friend who
bought Studio Photo wanted to see how it looks in 24bit color so he
borrowed my machine and Studio Photo didn't work in either 16 or 24bit
color, but that may or may not be NOVA's fault (Gemview and CoNnect work
without a hitch, in fact so did 1stword (not plus, the original that came
with the first STs)) however it worked fine in all paleted resolutions.
Since Studio Photo was shown on a Cyrel, he knew it worked with that card.
I'm happy with it, I just wish I had a better monitor <grin>. I almost
forgot, NOVA comes with a utility that lets you make custom resolutions so
you can exploit the limits of your monitor (you are just limited to
640x480 in 24bit color), and can use a hardware-scrolled virtual desktop
(scroll around in a 1024x1024 region with a 640x480 window, etc.).

>--
>Opinions expressed are my own.

Source record: 200555

I realize you said you wanted something on a command-line, but if
you get Diamond Backup III when its released in October, you probably
might change your mind about GEM=bad (or unusable or inflexible, etc.). I
saw the prerelease at the Glendale show and I was very impressed. You can
save macros, prefs, it supports both ACSI and SCSI ports of the TT and the
SCSI port of the Falcon, UNIX's TAR (it may even support Unix compress for
tar.z files), their own Diamond Back format, on-the-fly compression, and
any tape drive that follows the SCSI-I convention.

If you have ever used Fastback, the fileselection is very similar.

Toad sells NVDI. I don't have the number, but I bet plenty of
other people do.

I agree. Not only is Warp9 buggy, but it doesn't work with _any_
video cards and it doesn't work with MTOS.

Actually, since my NOVA card mostly replaces the VDI anyway, all I
really need is a good backgounder that works with video cards, and a
screen saver (NOVA has a screen blanker which works fine, but neither
Warp9 nor BeforeDark work with it).

Strange thing is, I used to have and AdSpeed, and I was not expecting double
speed from my applications, but literally everything was absolutely double
speed; Calamus screen redraws, loading files into or saving them from Touchup,
and a ton of other things which I sat down with a stop watch and timed. Overall
I could not have been happier with my AdSpeed board.

From: rcollins@magnus.acs.ohio-state.edu
Message-ID: <288em1$7h6@charm.magnus.acs.ohio-state.edu>
Source record: 200559

I have a TT030 and to autoboot Dungeon Master I must turn on my machine and press the space bar as so as the monitor comes on (you will hear the click if done to fast there will be no sound) this prevents the machines RAM test and drops the screen resolution to ST low rez. Next, you must hold down the Alternate key immediately after pressing the space bar.

: --
: ---> Kendall Gelner (kendall@rice.edu)

OK then. I have on my work PC a word processor and a graphics package running, and a file manager. OK it is slow, but I can type away at my word processor, then check my disk space, perhaps send the file over kermit and then go back to my word processing - all without exiting a program. And the file transfers carry on in the background (albeit slowly). Don't I need MultiTOS to do that on my ST?

>lots of time to fix it.
>

The problem is not the libraries, but the definitions in the header files. I tried building E_GEM1.2 using Lattice 5.5 a few days ago, without Mint libs. The main problem is in the use of the AES OBJECT structure: Pure C thinks the ob_spec field is a union of pointers to TEDINFO, ICONBLK etc. Lattice C users know the ob_spec is a void *!

The quickest way to change it was to nick the definitions of OBJECT from the GEMFast libs, and then globally change OBJECT to XOBJECT to avoid clashing with the Lattice aes.h definition.

The library now works, 99.9%. (The clipbrd_save() and clipbrd_load() bus error at the moment, I'm tracking it down) There are a few mis-declarations, like having int * where short * is required (save_clipping() etc)

Is there any documentation (in English??) for using E_GEM?

This is all very well, but can it handle Minix partitions and Spectre partitions?

I know that Tar would also be useless for a Spectre partition.

It would be nice if there were a package which could do both image dumps of partitions (for formats such as Spectre) and also handle non-MSDOS(TOS) formats such as the increasingly popular Minix format.

Any takers?

Steve

PS. tar.z is GNU gzip format, as is tar.gz. tar.Z is Unix compress format.
PPS. In my environment I CAN'T use GEM as I haven't got the MultiTOS multitasking AES and run MiNT with memory protection turned on. I also only have one very small boot TOS partition, the rest are all Minixfs. If I could do without the TOS partition I would!

WW> with.

If a users using anyting but a harddrive, downloads an archive from my BBS (I'm using XYZ v2.02Beta, my patched version with extended "Timeout-Timers") ConNect will send "Transfer aborted" when the user is saving to disk .. thus my BBS doesn't update the download flag ..

Common program, about 50% of all Zmodem programs have this.

I'm not complaining on ConNect though, you're probably doing the right thing in your Zmodem ... We'll just have to make another patch for XYZ .. (Too bad it isn't supported at all anymore .. hard to disassemble C programs ..)

4696. 16-BIT-MUSICEDITOR (FALCON) FINALLY AVAILABLE!!!

Newsgroup: comp.sys.atari.st
Date: 1993-09-28 12:06:47 UTC
From: b_kirsch@mubo.saar.de
Message-ID: <1993Sep28.120647.3115@mubo.saar.de>
Source record: 200409

16-BIT-MUSIC-EDITOR (Tracker) for Falcon finally available!!!

Hello Musicians!
Finally, there is a CD-Quality-Music-Editor for the Atari Falcon! (The first in the world for any computer?)
The program named "Deluxe Mjuzakk Zerbastel Kit" is Shareware and runs on a Falcon with at least 4 MB of Ram, Harddisk and VGA-Monitor.

Some Features:

-The editor-concept is similar to the good(?) old soundtrackers (MOD-editors), but more comfortable.
--The DSP is able to mix and change the frequency of around 6 tracks in realtime and CD-quality! With worse quality, there are up to 10 tracks.
-You are able to use more than 40 different samples with no length-limitation in one song.
-You can choice the stereo-position of every sample while using only one track.
-There is a sample-editor to cut, loop and reverse a sample. (DSP-effects (echo, filters, pitch...) are possible by using any harddiscrecorder-software (Winrec, Musicom...))
-The program works with 16-Bit- AVR-, SND-, and DVS- (packed or unpacked) Samples.

The shareware-version of this program (with german documentation) should be available at:

-Maus Saarbruecken Tel. +49 681/3904998
-ftp-server ftp.uni-erlangen.de

and other ftp-servers.

enjoy!

4697. Heat 'n Serve C mailinglist opened

Newsgroup: comp.sys.atari.st
Date: 1993-09-28 12:33:56 UTC
From: error@stack.urc.tue.nl
Message-ID: <289avk$ddt@tuegate.tue.nl>
Source record: 200570

It finally has happened,

after a week of trying and bugging system administration the Heat 'n
Serve C mailinglist is opened.
To subscribe send mail to hsc-request@stack.urc.tue.nl with subject
subscribe
or send it to the same address with subject help to get some help first.
There is still one minor problem, but that will be fixed soon en is
explained in the help file/welcome message.
The hsc mailinglist is meant for discussion of everything that might be
of interest for programmers that use Heat 'n Serve C or maybe even the
original Sozobon C.
Subjects could be: libs, example code, programmers utilities, bugs in
HnS C, how to..., why won't this .... etc.

Erlend.

How about... cat? It's in the GNU Text Utils or built into the Mupfel
shell, both of which can be found on atari.archive or its mirrors.

Beware; Mupfel's cat is incredibly slow. Glacial, in fact.

STalker should work fine on a Falcon with MultiTOS. The most important thing
you need to do to get it to work is turn off STalker's memory protection flag.
Also, if you want to use speeds above 19200, you need to set the communication
port to be TT/Mega STe Modem Port 1.

Source record: 200573

Well, my local newsfeed has kinda been down for the past week. So, any new exciting announcements or anything I missed? (other than the usual .advocacy stuff :-)

Anyways, to keep on subject for the group, here's a nice setup for those [Mega]STe users who'd like to view pictures with good quality and who don't have a graphics card:

-get a copy of Gemview and Double2
(double2 is that one that lets you have a screen twice as high)

-boot into ST LOW, and load in DOUBLE2 in *interlaced* mode
(left-shift held down during the load)

-the screen should now be in 320x400x16 mode interlaced

-load in Gemview

-under the preferences (or the other one under it?) set DITHERING to 16 GRAY

-now when you load in pictures (particularly GIF or JPG) you'll get a 320x400x16 grayscale picture which looks rather good considering only 16 colors (if you don't set the Dithering to grayscale, the picture probably won't look as good, though it would be in color)

-in grayscale mode, using the shrink or enlarge (half/double) option makes the resulting picture look good; in 16 color mode, doing a shrink doesn't look quite that good (real funky color scheme)

-I believe that the screen snapshot program that comes with Gemvieww *will* work in this doubled mode

Anyways, just thought someone may be interested...

>has not been translated, but you should be able to get by with a good
>German/English dictionary.

If you know a bit of C, there's very little need for a German
dictionary. The online help may not be as useful, but it's great as a
quick reference for how a function call is put together, without digging
through a book for it.
The biggest drawback is that if you want to use the macro assembler,
you'll definately have some work figuring out the directives. I found it
easier to clip out the hjelp pages and run them through the
German-English translator program. Gribnif, of course, provides support
on GEnie.

From: CHRISTOPHG@BIOMED.UIO.NO
Message-ID: <289g8r$ohc@hermod.uio.no>
Source record: 200572

Hello

I've just installed MiNT V0.95 and TCSH for MiNT. Now I have a few questions:
- cshrc.csh contains a line to set the prompt which has no effect. Any other commmand in there is executed properly. If I try to do a source on this file the "set prompt" isn't performed either. What's wrong?
- when MiNT is started at system boot something like a key-click is enabled. This is not the case when starting MiNT form GEM. Perhaps I should add that I am not very familiar with UNIX and TERMCAP. Has it something to do with this?
- All my files belong to "wheel" or "0". Trying to change the ownership with chown results in an error (illegal function number). Any ideas?
- somewhere in the readme of TCSH is stated that cursor up is or can be mapped to previous command (CRTL-L). How?

I think that's all for the moment. Any help would be appreciated.
Perhapts I should add that the system is a TT running in ST-mode.

Hi dear Atariers,

Has anyone of you ever used Unix Windows (uw.arc, uw.tar.Z, uwREADME in a.a). The readme file supplied goes on about Mac stuff, and I was wondering if it is possible to use the program on the atari to access my X-Windows account from home. Is this a X-Windows clone. Will it give a motif feel to my Atari screen when logged on to a X-server?

Replies would be appreciated, from people who have been exposed to this.

4706. Help, I can't unzip!

Newsgroup: comp.sys.atari.st
Date: 1993-09-28 15:15:45 UTC
From: georgew@tekig1.PEN.TEK.COM
Message-ID: <11700@tekig7.PEN.TEK.COM>
Source record: 200576

Hmm, maybe I should have reworded the subject line.

Specifically, I can't unzip files I've gotten from atari.archive.
When I try using the versions of unzip that run on Unix (unzip V1.0)
or my PC, they report something like "unknown compression method" for
each file in the zip archives. I tried downloading three unzips for
the ST as well. (I have a 520ST.) The results were:

unzip41.arc:
Same results as the PC and Unix versions.
gzip06st.zoo:
From desktop with -d flag, nothing loaded, it just exits.
Running from gulam, it reports tos error -39: not enough memory.
stzip23.tos:
(There were no docs with this one.)
Running from desktop, with nothing loaded, it just exits.
Running from gulam, I get two bombs.

I also tried downloading gzip107st.zoo from the Othergnu directory, but it
seems it's been deleted since I got the index.

Anybody know which version of zip I need for a 520ST?
Or if they all need 1Mb, is there a newer version I can compile for Unix?
Or even (shudder) a newer binary for a PC?

Thanks,
George.S.Walker@tek.com *OR* georgew@tekig1.pen.tek.com
OR uunet!tektronix!tekig1.pen.tek.com!georgew

Nope, I meant the old NEC 3D, which is ALSO rare as a foul's dental work. It
is (was) one of the few quality monitors which could sync LOW enough for Atari.

Whoa, hold on there, gentlemen! In the first place, the new Warp 9 upgrade
_is_ MultiTOS compatible, is it not?. You can make your own decision about
whether or not it is worth the upgrade price.

Secondly, Darek's original code wasn't buggy in the first place, it just was
not written for a multitasking environment. Methinks there is considerably
more to the issue that what you are giving John and Charles credit (or undue
flames) for. I could do without the screen font gizmo, but like the extendo
save screen savers. If you prefer NVDI and consider it a better value, that's
fine and dandy. But please do NOT accuse the CodeHeads of "just adding pretty
stuff to increase sales." That's neither true or warranted, IMHO.

4709. Windows 3.1 driver for Atari Laser Printer

Newsgroup: comp.sys.atari.st
Date: 1993-09-28 15:42:03 UTC
From: osuna@isi.ee.ethz.ch
Message-ID: <CE2MA5.Gs1@bernina.ethz.ch>
Source record: 200580

Where can I get a Windows 3.1 driver for an Atari Laser printer
(?? 605) from? Is it possible at all to connect the Atari printer
directly to the PC? It would be sufficient to copy the printable file
on floppy, pass it to the Atari computer and print the file from
there with the Atari printer.

I do not think that it is necessary to buy a new laser printer if one
wants to "upgrade" from Atari to PC. ;-)

Thanks for any hints

Jose

Hi,

Having looked at a few GIF viewers/convertors, PhotoChrome 3 (I think that's the version I've got) seems very good - Apart from when you want to view a gif that is bigger than 320x200 and doesn't have that aspect ratio. I know the "Squash Gif" option is there - but this doesn't keep the aspect ratio so the pictures get distorted.

Is there a newer version that keeps the correct shape, or is there another way round this ?

Thanks,

Martin

^^^^^^^^^^^^^^

This might sound like a stupid question, but does this mean that we can hook up a DAT drive to the machine and get away with it? So far I've only seen support for the "usual" tapes.

|> file the "set prompt" isn't performed either. What's wrong?

Some of the characters describing the prompt format have to be escaped. Many of them have an alternative form. Did you try these? What prompt format do you want?

|> - when MiNT is started at system boot something like a key-click is enabled.
|> This is not the case when starting MiNT form GEM. Perhaps I should add that I
|> am not very familiar with UNIX and TERMCAP. Has it something to do with this?

No, I guess. I think you switched off the keyclick in the control panel of the desktop. But this is never invoked when you specify tcsh as INIT in mint.cnf. There should exist some small program to switch off the keyklick from the auto folder/mint.cnf.

|> - All my files belong to "wheel" or "0". Trying to change the ownership with
|> chown results in an error (illegal function number). Any ideas?

You`re using the standard TOS filesystem, aren`t you? It doesn`t support things like owners (users or groups). If you want this feature (and many, many more) you need a minix filesystem. And if you want it to be of any use you have to run the init-suite on startup.

|> - somewhere in the readme of TCSH is stated that cursor up is or can be mapped
|> to previous command (CRTL-L). How?

Use the bindkey command. It`s explained in tcsh.man. And it`s done in the sample rc file mentioned above. I could post the relevant parts if you`re interested.

Bye,
Stephan

>home. Is this a X-Windows clone. Will it give a motif feel to my Atari screen
>when logged on to a X-server?

No, I don't think that Unix Windows is an Xwindows clone or anything
like that. From what I've tried of it, the main intent of the
program is to allow a user to have multiple "windows" into a unix
system through one login. For instance, you could have say three windows
open, each at a command line. Then do different things in each
"session/window." That way you can get a lot done with one line
out (from your computer/modem to the unix box)...

I haven't tried the MAC version; the Atari ST version allows I think
7 or 10 windows; the PC version is full screen for each "window" (you
toggle full-screens to get between each); I think the Windows 3.x
version is similar to the ST's...

I believe the "server" (the part that runs on the unix box) should
work regardless of which computer you're using to access it (at least the
ones I've mention, anyways; maybe the Amiga as well if they have the
UW front end)...

A slightly easier way to get multiple sessions (although this
isn't as fancy as UnixWindows) is to get "Screen" which lets anyone with
a VT100 (ANSI?) emulator to toggle between sessions/windows...

As for Xwindows clones, I dunno. (a question from me to the net:
how does MGR compare to Xwindows in terms of purpose, features, etc?)

: home. Is this a X-Windows clone. Will it give a motif feel to my Atari screen
: when logged on to a X-server?

unix windows is a simple line multiplexer. it gives you up to 7 or so
simultaneous text based sessions. It is pretty nice for home work, but
it has nothing to do with graphics or X windows. There is an atari client
for UW. I think the latest mac clients can do some tek emulation, but
I don't know at what level the atari client is. In all cases you need
to install the uw server on your host machine.

Ok, this is a very simple VDI question... How does GEM interpret
the VDI co-ordinates when it is given (for example) a v_bar call?
Is it the entire GEM screen, or relative to the active window, or
what ?

All help appreciated...

Simon.

In article <1993Sep28.081553.15435@ajax.rsre.mod.uk> haines@minotaur.dra.hmg.gb (John Haines) writes:

OK then. I have on my work PC a word processor and a graphics package running, and a file manager. OK it is slow, but I can type away at my word processor, then check my disk space, perhaps send the file over kermit and then go back to my word processing - all without exiting a program. And the file transfers carry on in the background (albeit slowly). Don't I need MultiTOS to do that on my ST?

Not nessicarily - you can use desk accessories, or something like juggler to do task switching (which is what you are doing). I will concede that the Desktop alone is somewhat less functional than Windows (though if you use desk accessories wisley, not much - I could do all you described)

But with MutliTos, I get all of that and much more - I get real preemptive multitasking, Like I can start a download going, then start some image loading, then go back to my WP and type away. WIndows alone is just not this cooperative... I have to use Windows at work, and find Multitos a lot nicer.

4720. Need help converting NeoChrome to DOS image format

Newsgroup: comp.sys.atari.st
Date: 1993-09-28 17:14:29 UTC
From: wjr@pacific.uucp
Message-ID: <289rdl$r8v@netline-fddi.jpl.nasa.gov>
Source record: 200588

I am looking for a way to convert Atari NeoChrome images over
to some PC (DOS) format, such as PCX. The NeoChrome images
are standard 320x200x16color.

Are there any conversion programs available to do this?

I have tried to convert the images manually, but I can't
figure out how the NeoChrome Images are stored. I do have
a file discription of NeoChrome format, but it doesn't seem
to be correct. Subtracting the header (something like 128k)
you are left with a 32000 byte file which contains data for
a 320x200 images. This works out to 4 bits per pixel, or
2 pixels per byte (with DN valaues of 0-15 for each pixel),
which is what I expect. But, when I split each bytes to make
a 320x200 array, the pixels do not match the original image.

I have assumed that byte 1 represents pixels 1 and 2 (on scan
line 1), byte 2 represents pixels 3 and 4, and so on. This seems
to be incorrect, but I can't find another way to do it.

If someone has a simple images converter, this problem will
be moot, otherwise if someone can explain how the NeoChrome
image is stored, I would be grateful. If you can tell me
how to convert a 32000 byte NeoChrome image into a 320x200
array with pixel values ranging 0-15, I can do the rest.

Thanks

Joe

Hi, and thanks for all the stuff, well let me get down to business,
I have gotten connect up on my F030, even in multitasking mode but
THERE IS ONE BIG PROBLEM. I am not sure if connect understands my modem
my school uses the Asynchronous IBX modem for dorm-unix communicattions.
Once you get a telecom package, and hook the modem cables and IBX plugs
(an IBX plug is just a telephone jack), you should get a prompt
that says "Welcome to IBX", no dial-up neccessary. This
should happen immediately you hook up. However I do not
know how to find such a prompt in coNnect, or even if coNnect understands
my IBX async modem. The question is how do I start up coNnect ....
for use as a terminal for my situation ?

Thanks again ... Mr. Amalaye Oyake ...

Well, I'll go along with the old idea that a program is most useful in the long run if it does one thing very well. But the whole point of the latest version of Warp-9 is that it DOES work on the Falcon with MultiTOS. And as such, it's the Codeheads's first effort at a Falcon TSR. I presume that this version will break under some circumstances, but I presume too that there'll be a couple of free upgrades before the next for-money one, just like last time.

VDI screen coordinates normally have their origin in the upper lefthand
corner of the screen. The origin definitely does not depend on the
position of the active window, because the AES is "above" the VDI.

When I turn on my 1040STf, the whole FM radio band gets filled with static, for at least a 100ft radius or more. It's not the monitor or floppy drives or hard drive, it's definitely the computer. As far as I know, all the pieces of the RF shield are present and installed correctly, and there have been no hardware hacks made on this machine.

Can anybody give me a clue on how to track down/fix this? Or should I just strip it down and sell the pieces, before the FCC tracks me down?

I believe that Gemview handles NEO pics, and the registered version
will let you save to GIF, BMP, and other formats. GIF and BMP alone
are quite popular and would be easy to deal with on the PC side as well...

You can't do that because of Atari's weird interleaved video memory. As near as I can remember, in low rez, the first bits of the first four pixels are stored, then the second bits, then the third, then the fourth, and then the next four pixels are stored in the same manner. I could be wrong about the details...

Anyway, there should be numerous programs that'll convert a .NEO pic to a GIF picture. Try atari.archive

As of 5.6 (RSN honest) I introduced a couple of macros which if defined
get auto-substituted in to allow for these kind of redefs; IIRC its along
the lines of

#define __OB_SPEC union ob_spec

where a union ob_spec is something you already declared.

[suggestions for an attenuator on a line-level output]

For what it's worth, I've plugged a cable into my Falcon mic from both my receiver headphone out and my CD player headphone out and recorded with absolutely no problems at all. From my limited understanding of audio impedances, you just have to make sure the the impedance of the ouput device is lower than the impedance of the input device. This is why you can plug a headphone out from a CD player (typically about 32-100 ohms) into a line level on your stereo, which is like 10K ohms or something similarly huge. My local Atari dealer told me from the Falcon specs that that headphone output on the Falcon needs to drive a 32 ohm or greater load (like most any pair of headphones are), which means it's no loss of quality to plug into your stereo since the stereo has an input impedance of many K ohms.

Now, for the mic part of things, I believe (don't quote me on this, I wrote it down a long time ago but since forgot) that anything <1000 ohms is OK to plug into the Falcon mic. Which would mean that a headphone output (32 ohms) is fine to plug in, while a line level output (10s of K ohms) is not.

If anyone has anything to add to this or other questions feel free to add more. I think the main point is that you can plug headphone outputs into just about anything (provided you can adjust the volume to a reasonable level) since they're pretty much at the low end impedance-wise (well, except for amplified speaker leads but who would want to plug that into their Falcon :-)

P.S. -- When recording from headphone jacks I usually set the input gain a lot lower than with a microphone.

Regards,

I had to make a one time adjustment to my SM1224 to get rid of this. I
remember "Star Wars" scrolled vertically until I did this.

Do you mean you have problems because the programs in question don't
automatically switch Hz? If so, there is a 50 Hz booter program available
It switches sync rates, then prompts for a new disk in drive A, then
reboots (while preserving the 50Hz sync). It should be on atari.archive.

4738. Problems with WINX 2.1

Newsgroup: comp.sys.atari.st
Date: 1993-09-28 21:34:00 UTC
From: Jan_Willekens@p12.f202.n281.z2.fidonet
Message-ID: <2ca8b050@p12.f202.n281.z2.fidonet>
Source record: 200256

Hi!

I have encountered some problems with WINX 2.1. Are these known problems or
is my setup to blame?

Problem with:

LED: When calling eg. the control panel, LED's topped window isn't redrawn
after I closed the control panel. An untopped one is redrawn.
Using the drop down menu is impossible. If I select an entry, the
program does not react and the menu entry (eg. Edit) stays
inverted. Now if I don't select an entry in a drop down menu, but
only let it drop down and then click somewhere else outside the
drop down menu, and then press a key, 'nothing' happens. I have to
press that key again for it to appear in a window. (while I am eg.
writing a message)

EASE: When I resize a window in such a manner that it becomes larger,
the area inside the window isn't redrawn properly. I keep seeing
the sliders and the arrows, etc. (difficult to explain, this one ;-)

My WINX.INF:

```
.GLOBAL = 5-

.LOCAL =
= # GEM-Desktop
TC* = 1- 11- # Beispiel fuer eine Applikation, die keine Kontroll-
# elemente an hinteren Fenstern erlaubt und ihre
# Fenster nicht links rausschieben laesst
EASE* = 1- 3- 4- 5- 6- 7- 8- 9- 10- 11- 12-
LED* = 1- 3- 7- 11-
```

I use this on a TT 4/4, with NVDI 2.50 and ROMRAM.

Hold down <Alternate> when the Atari logo first shows up, release it when your
game begins reading from floppy.

If I remember correctly, Bitstream has more than 1000 fonts ready for purchase, which will all work fine on SpeedoGDOS.

I've tried several sources - Bitstream Facelift fonts taken from my Canon Bubblejet 20 box, some COMPO additional fonts for That's Write and others.

Result: 51 fonts instead of 14 :-)

bye, Peter

You have two options I think, either use the GREAT ST-Emulator BackWard v2.1 which automatically boots up the disk for you (and get a lot of ST-games to work on the Falcon), or you could try to hold <ALTERNATE> on bootup, and wait for your Falcon to read the disk drive once, read the harddrive shortly, immediately efter the harddrive stops "whizzing" you should let go of <ALTERNATE>....With a little luck this will work...(of course you have to set the NV-RAM to boot up in ST-Low)... Is there another way???

Hi,

I just came back from vacation, and had MANY mail messages asking
for my Motif-like GUI demo...

It has been uploaded to the UMich archives as ICON.ARC, and I
encourage you to grab it, and try it!

NOTE - COLOR MONITOR REQUIRED!

Thanks!

John

4743. Pagestream to IBM Wordperfect?

Did you type a '=' without spaces around it after the 'prompt', i.e.
set prompt='something'? Some people confuse the syntax of set with that
of setenv.

>- All my files belong to "wheel" or "0". Trying to change the ownership with
> chown results in an error (illegal function number). Any ideas?

Do you try this on a GEMDOS partition or a minix partition? Only the
minix fs knows about owners of files.

>- somewhere in the readme of TCSH is stated that cursor up is or can be mapped
> to previous command (CRTL-L). How?

You can do that with the program xkey. I don't remember the syntax, though.
I also don't know, if there is a way to do that in tcsh.

Urs

I have found at least two slightly different situations that seem to
depend on who you are connected to. On the unix system at work (like the
one I'm using right now) I can do a zmodem transfer (SZ FILE.TTP or
whatever) and everything works as is..s.

However, I've found that if I want to do a zmodem transfer from my PC
to GEnie, I need to have "Force Ackn" set on (and No Multitasking
sometimes helps as well). I haven't had this situation on any BBS or
anything else - just on GEnie...

Anyways, those settings may eliminate the timeouts...

Me not...well then..guess why ;) <grin>

>chance to see it in action at the Glendale Atari faire and I've been
>regretting my decision to buy my NOVA ever since (of course, at the time I

THat's very unfortunate....however you are able to upgrade to a SUperNOVA with
regular NOVA if supergraphics is what you want....:) and I'd say SuperNOVA
is on par with the Cyrell.

>bought it, it was a good deal but such is hindsight).

Maybe not ;)

> One thing to remember is that the Cyrel is the best, _not_ the
>cheapest. At the Show it was on special for $1000, normal Retail was

hmmmm....;) a little quick on that one :) There are SUperNOVA and MAtrix
TC1208 Graphics Cards around too you know ;)

>$1500. However, it supports 800x600x_32bit_ (not just 24bit like the
>NOVA), it was _much_ faster in all resolutions (it has something like

Cyrell is a very fine card...however I'd say that the Card to compare the
Cyrel with is the SuperNOVA not regular NOVA as that cost's about 529 U$D
which happens to be about 1000 U$D cheaper than the regular Cyrell Retail..
I mean if that is a problem..I guess you've got a lot of money ;)

Also the SUperNOVA IS a 32bit Graphics Card and both Cyrell as well as the
SUperNOVA can display 640x480 in 32bit Color Graphics (not 800x600x32bit as
both boards have 2 Megabyte VRAM and 800x600x32bit wouldn't fit in VRAM)

The SUperNOVA regular retail is 999.99 U$D :)

>twice the pixel clock of the NOVA...128MHz sounds right) and it had the

SuperNOVA has 135 MHZ, regular NOVA has 90MHZ

>ability to intercept calls to the hardware so that most software that is

Did you try using the Emulator.PRG with the NOVA?

>not "video expansion aware" worked fine in the TT or ST compatibility
>modes. Also, unlike the NOVA, the Cyrel is all on the VME card, whereas
>the NOVA is a VME adapter to a black box containing was is esentially a
>ATI 24-bit graphics card.

The SUperNOVA is essentially a Graphics Ultra Pro from ATI, which is a 32bit
Graphics Card..once again ;)

And what is the advantage of that? You can use one of the best and most
respected graphics cards in the PC Market not only on your TT or Mega STE
but also on your PC if you wished to do so, considering the way the market
is heading...the SUperNOVA allows you to go both directions. If you read the
CICERO Extrablatt, they commended that idea and concept.

>
> That being said, the NOVA is still a good card. In most

It sure is..so is the Cyrell but you can't really compare NOVA and Cyrell,
you're comparing a 529 U$D product to a 1500 U$D product...I'd say that
Cyrell needs to be compared with the SUperNOVA or the Matrix TC1208 which
is unfortunately not available in the USA.

>resolutions, it is faster than the built-in video of a TT. It is pretty
>solid in coping with other software. The only slowness I have ever

The added strenght of the NOVA is it's compatibility and software that
comes along with it, eg. ReSWTICh that allows you to switch the
resolution and colors without a reboot. Also it has a very fine VMG allowing
you to produce whatever resolution you like on your board.

>I'm happy with it, I just wish I had a better monitor <grin>. I almost
>forgot, NOVA comes with a utility that lets you make custom resolutions so
>you can exploit the limits of your monitor (you are just limited to
>640x480 in 24bit color), and can use a hardware-scrolled virtual desktop
>(scroll around in a 1024x1024 region with a 640x480 window, etc.).

What's also interesting is that NOVA Boards can be upgraded..you can use
the same board in a Mega ST, Mega STE or TT...just need the adaptor which
is available. What is also interesting is that you can use your NOVA on a
regualar 1040 or 520!

>
>-Mike Baffoni
>Happy Nova user.
><who secretly wishes he had the money for a Cyrel>
>

Yat Siu
Happy SUperNOVA user <grin>

Ps: Well Mike...if you really want 32bit Graphics and high speed you can upgrade your NOVA to a SUperNOVA...

You have the Nova VME 16m, don't you? Same here. The SuperNova is much
better. It has a 135Mhz bus and does 32bit color to 800x600 as well. Of
course it's another $400 more than the 16m, but less than the Cyrel.
I've never seen either the Cyrel or the SuperNova in action though, so I
can't say for sure which is better...

I think that you can get around 1000 different Speedo fonts from Bitstream.
Of course it would be nice if there were more, if they were cheaper, if
you could convert PS fonts and so on...

But come on: FSM was slow, used *totally* strange fonts and was broken
regarding Line-A. Now we finally got Speedo, it works, there are fonts
(and you can really buy it).

If anyone needs to "wake up and smell the coffee", it's people wearing Atari Corp issue rose colored glasses...

There's a little third-party support for the Falcon, that's true.. but there's very little from Atari itself, and a market can't grow very much on the shoulders of independents alone.

Atari has virtually dropped the Falcon... what makes you think the little guys can make it go when Atari would rather play video games..?

(So tell me.. what exactly is a "whinge"..? :)

From: goemon@venice.mps.ohio-state.edu
Message-ID: <28b9rj$qpk@sol.ctr.columbia.edu>
Source record: 200427
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The (in?)famous "Hardware documentation", revision 6.0 is now available.

It lists every known (and unknown) hardware register in every Atari
from the ST to the Falcon030, and everything in between. It also
details most of the register's functions.

This document is available on your favorite atari ftp site, or if you
can't get it, I can email a copy to you. It will be compressed
and uuencoded, however. No exceptions.

It is available on most atari ftp sites as "hardware.txt".

I think CodeHead is well aware that Warp-9 doesn't run under MTOS - they
don't need user bug reports. Warp-9 doesn't work well with WINX either,
which is another example of an operating system change.

MB> My understanding is that NVDI is a "software screen accellerator",
MB> somewhat similar to Warp 9 and such. I seem to remember that
MB> there are some fundamental differences as well. My questions
MB> are:
MB> 1. What does it speed up (everything, VDI calls only, etc.)?

It replaces the VDI with a faster and more extended VDI. So it speeds up
about everything your ST does with its screens. It also gives you GDOS.

MB> 2. Can you install both NVDI and Warp 9? Is this good? Is this
MB> stupid?

It's stupid ;-) Unless you want to see loadsa bombs! :-))

MB> 3. Do I want it for my particular ST (Mega2ST, running TOS 1.2)?

If you are satisfied with Warp 9: No. If not: yes. I have both, and for
things like terminals and online stuff I use NVDI, becaus Warp lowers my
CPS rate. For normal use I use Warp 9. (I really like the screensavers)

MB> Also, I have seen mention of bugs in Warp 9. I have yet to run
MB> into any, but I don't run MTOS. Is this where the bugs show
MB> up?

I haven't seen any...

One thing bout P3 that irritates me is that if the gif is smaller than
320*200 it blows it up. Still, just to have that line going up and down
is worth having the program.

4762. Saving Falcon resolution screens to file

Newsgroup: comp.sys.atari.st
Date: 1993-09-29 09:13:13 UTC
From: Matija.Grabnar@ijs.si

Does anybody have a utility capable of saving the screen to a file on a Falcon?
There used to be a lot of savers that would make a .PI[123], or a
monochrome .IMG file, but is there anything that would enable me to save
a 256 or TC resolution on the Falcon?

FTP-able, preferably....

Thank you very much.

Go look at atari.archive.umich.edu there should be a lot of stuff in there
which does what you want to do.

>I have tried to convert the images manually, but I can't
>figure out how the NeoChrome Images are stored. I do have
>a file discription of NeoChrome format, but it doesn't seem
>to be correct. Subtracting the header (something like 128k)
>you are left with a 32000 byte file which contains data for
>a 320x200 images. This works out to 4 bits per pixel, or
>2 pixels per byte (with DN valaues of 0-15 for each pixel),
>which is what I expect. But, when I split each bytes to make
>a 320x200 array, the pixels do not match the original image.

>I have assumed that byte 1 represents pixels 1 and 2 (on scan
>line 1), byte 2 represents pixels 3 and 4, and so on. This seems
>to be incorrect, but I can't find another way to do it.

Wrong.

The way the ST's screen works (which is also the way Neochrome saves) is as
follows:

for each 4 consecutive bytes in the file, you have 8 bits. (right?)
The screen is divided into bit-planes, where the first byte holds bit-plane 0,
the second byte bit-plane 1, up to the 4th byte, which holds bit-plane 3.
Then the process is repeated.

Now how this eventually gets displayed:

```
bit-plane byte contents of byte
0 1 1 0 0 1 0 1 1 0
1 2 1 1 1 0 1 1 0 1
2 3 0 0 0 1 1 0 1 1
3 4 1 0 0 0 0 0 1 1
| | | | | | | |
1st pixel colour -------~ | | | | | | |
2nd pixel colour ---------~ | | | | | |
3rd pixel colour -----------~ | | | | |
4th pixel colour -------------~ | | | |
```

5th pixel colout ---------------~ | | |
6th pixel colour ----------------~ | |
7th pixel colour -----------------~ |
8th pixel colour ---------------------~

So, for the first pixel, you take bit 1 of bitplane 0 as the MSB, and move
down to bit 1 of bitplane 3 which is LSB.

How the bit-planes themselves are arranged: bytes 1-4 contains the 1st 8 pixels
of scan-line 1, bytes 5-9 contain the next 8 pixels, bytes 10-13 the next 8,
etc...

If you want a better explanation, email me, and I'll spend a bit more time
explaining it. This was only put together in a bit of a rush, so my apologies
if this is not too clear.

>If someone has a simple images converter, this problem will
>be moot, otherwise if someone can explain how the NeoChrome
>image is stored, I would be grateful. If you can tell me

4767. Infocom adventure game interpreter for Atari ST (new)

Newsgroup: comp.sys.atari.st
Date: 1993-09-29 09:59:37 UTC
From: joedal@dfi.aau.dk
Message-ID: <joedal.749296777@dfi.aau.dk>
Source record: 200435

Wasn't any of you angry when the good old Infocom adventure games was republished - for PC and Mac only? Fortunately, it is possible to play these games on Atari ST machines. The games are distributed as machine-independent game files and an interpreter to run the games.

The games themselves are commercial, distributed in two many-games packages at a fairly low price. But without an interpreter you will not get much fun out of them. The good news is that some people (who call themselves InfoTaskForce) has written a portable freeware interpreter that can run all the text-only games.

In June I ported this interpreter to Atari ST computers, but there was a bug in my port, so it didn't work properly with all games.

THE BUG HAS NOW BEEN FIXED!

The interpreter works for all game version <= 5 (i.e. all text-only games).

The interpreter have been uploaded to the archive of Interactive Fiction (i.e. adventure games and the like) on ftp.gmd.de.
Look in the directory
/if-archive/infocom/interpreters/itf/
for:

atari.itf-bin.zoo Binaries and documentation. What you need to play infocom games with the program (of course you also needs the games themselves - buy them for PC and play them on your Atari ST).
The files are packed with Zoo version 2.1. If you don't have Zoo then get
/if-archive/download-tools/atari/atar-zoo.tos
first.

atari.itf-src.zoo Source code with full documentation. Includes the original files (some of which are slightly modified to make Sozobon C version 2.0 compile them) along with two new files ATARI_IO.H and ATARI_IO.C with the Atari-specific code.

ftp.gmd.de is in Germany, Europe. If you are living in the US you should download the files from the mirror archive on wuarchive.wustl.edu.
Look in the directories
/mirrors/if-archive/...

Notes: The Infocom game files can be bought as the game packages
The Lost Treasures Of Infocom
The Lost Treasures Of Infocom II

for PC and played on your Atari ST. They are rather cheap for
the amount of games you get, really.
But if you are the "never-buy" type (also if you aren't) you
should grab the file
if-archive/games/infocom/curses_g
This is a FREE game, written by Graham Nelson, that is made to
run with Infocom game interpreters. Try it - it's good!

|> There's a little third-party support for the Falcon, that's true.. but
|> there's very little from Atari itself, and a market can't grow very much
|> on the shoulders of independents alone.
Sure, Atari aren't doing very much for the Falcon. In the UK at least though there are colour adds in the computer magazines - full page. They have shipped MTOS, Speedo, Works and TOS 5 is on the way. You can buy programmers docs for the Falcon. There isn't much else they can do really. They make hardware, not software.

There is *plenty* of 3rd party software - especially for a relativly new machine. The quality of the PD alone is very good.

|> Atari has virtually dropped the Falcon... what makes you think the little
|> guys can make it go when Atari would rather play video games..?
Atari *are* concentrating on the Jag but who wouldn't given there financial position and the current trend in home computing v consoles. They're only doing what I would do in their shoes. They are a small firm who are finally doing some fairly smart moves to keep afloat. This *is* a new concept for them. Where exactly is your justification for the statement that Atari have dropped the Falcon? They make them, they sell them, they are still working on the system software.

|> (So tell me.. what exactly is a "whinge"..? :)
It's what you do all the time. I don't wear rose tinted glasses and I can see and admit to Ataris problems. What I will NOT do though is talk them into the ground by spreading rumours and false assumptions based on a narrow perception of what is going on.

4773. Atari ST, MIDI programs?

Newsgroup: comp.sys.atari.st
Date: 1993-09-29 12:30:19 UTC
From: etxpell@etlxd20.ericsson.se
Message-ID: <9309291230.AA20041@etlxd22u.ericsson.se>
Source record: 200439
Cross-posted to: comp.sys.atari.st,rec.music.makers,rec.music.makers.synth

Hello,

I'm an (so far) ignorant guitarist, about to enter the world of MIDI. I have an old Atari ST collecting dust somewhere, and I'm thinking of buying a synth module to use with my 4-track, both to generate drums but also to generate some bass and keyboard sounds.

The module I'm thinking of is the Boss DS-330 Dr. Synth, which in itself doesn't contain any programming functions (as far as I know, anyway). Now I wonder, does anyone have any experience with music programs for the ST (sequencers etc)? Since I'm a complete novice when it comes to MIDI, and these kind of programs, I don't really know what to look for - what kind of programs that exist, public domain vs. commercial ones, what's possible to do with them etc...

If someone could help me with some ideas, recommendations, descriptions of possible set-ups (email or posts), I would be most grateful.

Cheers,
Pelle ,,, ?

4774. More Falcon news

Newsgroup: comp.sys.atari.st
Date: 1993-09-29 12:49:25 UTC
From: pd@mbuc.bio.cam.ac.uk
Message-ID: <1993Sep29.124925.3778@infodev.cam.ac.uk>
Source record: 200440

Some more news which you may or may not have heard before

A "consumer" version of the falcon will be released soon.
It will be in a tower case although modelled to look more like a hi-fi.
It will not have a cartridge port or a scsi port(?).
It is mainly to attract new customers, "serious" users will need to get the
ste style falcon.

(It would be nice to have a real falcon in a separate keyboard/case style)

A German company called dhouse(?) has made a piece of software (I don't know
what it is called) which will allow virtual memory on the Falcon. Price around
60 uk pounds. It should be available in the next couple of weeks.

I am *EXTREMELY* happy at the moment. Cambridge Business Software are in the
process of opening a shop in Cambridge (5mins away from where I live) At last I
can actually see atari products before I buy them.
BTW they are selling 4/65Mb falcons for 850 uk pounds...
I want one I want one!!!!!

Falcon's which have 4megs of memory but a drive bigger than the normal 65mb have
been swapped around by the dealers (from original machines without a hard drive)
and so only come with a floppy version of multitos. This isn't an awful lot of
use!
Atari will also not take any notice of warranties if you need to send it back
because the dealers have opened the machine up. You are only left with the
dealers warranty.

BTW I do not work for Cambridge Business Software but I will be buying lots of
stuff from them :-)

After many years with my trusty ST I'm moving on and selling my complete system - *ALL* the following for $299.99 (OK, $300)+shipping or make me an offer if you're interested in individual items:

Hardware:
--> 1040ST (1Meg, 3.5"FD)
--> SC1224 Color Monitor
--> TimeKeeper Real Time Clock
--> Supra 2400 external modem w/cable and manuals
--> Joystick, mouse, printer cable, joystick extender cables

Misc:
--> All ST manuals
--> Abacus Atari ST Internals book
--> Abacus Atari ST Gem Programming book

Software:
--> Mark Williams C Compiler package (full package with books and Resource Construction Set)
--> WordWriterST
--> Falcon (Spectrum Holobyte) + Mission Disks 1 + 2
--> Gunship (Microprose)
--> Dungeon Master
--> Arctic Fox
--> Star Trek - the Rebel Universe
--> Bubble Bobble
--> Black Lamp
--> Blasteroids
--> Joust
--> Gridiron football

PLUS 100's of other assorted programs including games, utilities, art, music, demos, etc. (I'll include every ST disk I own...80+)

E-mail me at "kevin.wein@stpaul.ncr.com" and we'll work something out!

Thanks,

Kevin

The Apple][emulator in the Emulators directory of atari.archive is
basically a 6502 emulator. You have to load the operating system from
disk, if I recall correctly, so you should, in theory, be able to use it
to emulate an Electron...But the question arises: Why? Wouldn't it be
easier just to buy an old Electron (unless they're rare/expensive)?
Emulating it on a regular ST will be _slower_ than the real thing.

4780. 68882 coprocessors

Newsgroup: comp.sys.atari.st
Date: 1993-09-29 14:07:20 UTC
From: pd@mbuc.bio.cam.ac.uk
Message-ID: <1993Sep29.140720.7105@infodev.cam.ac.uk>
Source record: 200446

Are all 68882 coprocessors the same?
I might be able to buy one which is from a mac and I am wondering if it will
work in a falcon.
Does it have to be a certain speed or am I thinking of something else?

Thanks for any help,
Phil

4782. TT-Graphics card, but which one?

Newsgroup: comp.sys.atari.st
Date: 1993-09-29 14:23:44 UTC
From: schweitz@reich.uni-koblenz
Message-ID: <28c5pgINN3hc@mailhost.uni-koblenz.de>
Source record: 200447

Hi folks!

I'm looking for a VME graphics card for my TT. I'm interrested in:
- a fast card (faster than TT med would be fine)
- a cheap card (up to 1000 DM)
- True Color with at least 640*480 pixels (not for permanent working)
- a quick and compatible VDI-driver with True Color abilities or
- a card supported by NVDI(ET4000), btw. does it support TC?
- a flickerfree resolution of 800*600 for permanet working without slowing down the whole system

At the moment I'm thinking about buying a NOVA 16M VME, a Megavision300, a Spektrum TC or a Crazy Dots II.

So, if you know something about these card, if you are satisfied with one of them or if you would never buy the one you have got, if you can compare some of them, please write your experiences!

Thanks in advance!

This space is left free on purpose.

>
>Raymond Collins

Thanks Ray. Strange you should mention that because yes, there are some new projects in the works (although I can't provide details just yet). ;-)

While we are on the subject, allow me to invite all netters with GEnie access to tonight's Real Time Conference hosted jointly by Missionware Software and Fair Dinkum Technologies. The conference begins at 10 pm Eastern Time (7 pm Pacific) and you can join us by typing m475;2 at any GEnie prompt.

The purpose of tonight's RTC is to answer any questions about the recently announced venture in which Missionware Software has retained the exclusive rights to all of Fair Dinkum's current Atari software, to include:

Crossword Creator II
Word Search Creator
Puzzle Pack
The Cryptographer
Cyberdrome-The HoverJet Simulator (by Rhea-FX)

Beginning October 1st, Missionware will be the sole source for these titles (outside of your dealer, of course). I am _not_ abandoning the Atari platform, however! Far from it. I will still be providing maintenance and product support to Missionware for these titles and we have several enhancements in mind for them as well. All I am doing is letting Missionware take over the marketing end of the business so I can devote more time to programming for the Atari (not to mention potential Mac and PC projects).

To ensure adequate support, GEnie officials have consented to establish a new product support CATegory for Missionware Software through which I'll be online to answer any questions about specific Fair Dinkum/Missionware products.

Thanks for your time and I hope to 'see' you at the GEnie RTC tonight, 9/29/93.

Cheers,

-Hutch-

Source record: 200357

Hi Mike,

thanks for the nice words about our graphics cards. Did you by
any chance check out our software offers at the show. We do have
quite a bit more than 'just graphics cards'.

We are just releasing the new versions of our VDI drivers, once
again, we've improved the speed of the redraws and added some
features like the CyReL Ambiance Desktop Image Manager, which
allows you to either install a custom color palette fading (and enjoy
those absolutely stunning 16.7 million color hues) or your favourite
image in the desktop background. All this can most of the time be done
WITHOUT wasting your main memory. Special routines utilize the cards
memory to the maximum and take advantage of the extra fast redraw
capabilities. A special version for 'non-CyReL M16-1280' users will be
available shortly.

If you have any more questions, please feel free to drop me a note.

Thanks,

Ralf.

I have Geneva 1.0 and NeoDesk 3.04 on my system. I noticed a small bug(?) in the system. Whenever I move an icon, only the top half moves. The bottom stays in its original position. When I click on the icon, in the new position, the icon is redrawn in full. The bottom part of the icon in its original position stays until that part of the screen in redrawn. I tried removing all DAs and TSRs to no effect. Am I doing something wrong? This seems like a pretty big bug not to be mentioned.

|> generate some bass and keyboard sounds.
First out. You'll really need at least a 1Mb ST.

|> The module I'm thinking of is the Boss DS-330 Dr. Synth, which in itself
|> doesn't contain any programming functions (as far as I know, anyway). Now
|> I wonder, does anyone have any experience with music programs for the ST

|> these kind of programs, I don't really know what to look for - what kind of
|> programs that exist, public domain vs. commercial ones, what's possible to
|> do with them etc...
You can pretty much do what ever you want! You have sequencers which will provide multitrack programming. PD ones tend to only go to 32track. Commercial ones go to 64 track, 96 tracks and probably more. via expansion boxes. You can sync to SMPTE as well if required. These sequencers allow entry of notes in step time or via staves although generally only the better ones allow stave input (Notator). You can edit sequences, copy them about, add patch change info and just about any other MIDI msgs like pitchbend etc.

You can run voice editors that will allow you to edit/change the voices on your synths.

You can run software that with a suitable mixing desk will allow you to automate the final mix of a piece after first programming in the appropriate details.

You may also sample to disk via certain packages on the ST. With a Falcon, direct to HD sampling is much easier. Cubase Audio is a very nice sequencer with built in direct to HD sampling.

MIDI allows you to daisy chain many devices together including reverbs, synths, guitar MIDI pickups and more. All the control information for such setups can be stored/edited from within most sequencers.

|> If someone could help me with some ideas, recommendations, descriptions of
|> possible set-ups (email or posts), I would be most grateful.
MIDI is both a simple thing once you have got the hang of it and what you can do with it, but also quite hard to understand when you first meet it. Persevere. DOn't worry about asking questions.

This sounds too stupid even for Atari. I can't believe they would release a Falcon with no SCSI. What would you do with it?

|> (It would be nice to have a real falcon in a separate keyboard/case style)
Too right.

|> A German company called dhouse(?) has made a piece of software (I don't know
|> what it is called) which will allow virtual memory on the Falcon. Price around
|> 60 uk pounds. It should be available in the next couple of weeks.
There are at least 2 such programs. Outside is available as a PD demo that's adds 2 MB of virtual RAM. Nice for GIFs. :-)

|> I am *EXTREMELY* happy at the moment. Cambridge Business Software are in the
|> process of opening a shop in Cambridge (5mins away from where I live) At last I

Ok, I have all those cards that you are considering with me and my personal
favourite is NOVA VME 16 and second inline is the CRDOT's. However, the NVDI
doesn't run on it, but it doesn't have to because the NOVA VDI is fully
rewritten and is exactly as fast as the NVDI when run on a Falcon. NOVA has
already a built in 24bit VDI and cost I think in Germany (which is prolly
where you would get it) about 699DM,

It has software such as ReSWITCH that allows you to switch the physcial screen
rez and resolution without rebooting.
Emulator.prg will automatically emulate the standard ST resolutions so that
you can run the whole board via a single monitor
The accessory which includes naturally rez. switching into virtual modes,
screen saver, hor&ver shifting etc.
VMG for Video Mode generation etc.

It can go up to 90MHZ, 800x600 can definately go flicker free, however you need
the required monitor too ;)

It is very fast, especially the 24bit Driver at 640x480 is one of the fastest
I have seen for that price range. The Compatiblity is very high, I'd say with
NOVA you are on the right track.

I don't think the NVDI ET-4000 supports TC, only the special CRDOT's version...
anyone?

No. archive.umich is NOT at all very busy. They are just very
restrictive. They allow 10 to 60 anon ftp users depending on the time.

wuarchive allows 200.

A few years ago, umich was a decent place. Now I still like the
speed, but you can never count on getting on. (At any time)

i had a list of fsp hosts, but none of them work anymore. they change
every week or so. besides, transferring with fsp is like downloading
something with a 300 bd modem compared to ftp. i don't see why fsp is
still around... slow, constanly changing, horrid user interface, etc...
i guess it's supposed to be an underground protocol for pirates and computer
porno freaks, but i don't see how using a different protocol can aid in
those activities. it's not like the authorities are stupid and can't compile
fsp on their machine... ??? sometimes even computer people are irrational.

|> I like Connect but I am more familliar with Stalker V3.02.
|>
|> Thanks
|> Jack

I had problems with Stalker on my TT with MTOS (1.04 and up) but I solved the problem with a call to Gribnif.

There are to things to try first, from Gribnif:

If you are running STalker with MultiTOS, make sure that you have its memory protection flag turned off. STalker will not work correctly in memory protected mode.

Second, from myself:

Change Stalker to run in supervisory mode (I used Neodesk's show info to change it)

I prefer the second method because memory protection is still enforced for all other programs, and Stalker can access the serial port control registers.

In fact the compression method is unknown to these programs. It is the 'deflate'
method (included in ZIP versions >=2.0).

> stzip23.tos:
> (There were no docs with this one.)
There _are_. This program is a self-extracting archive. Just run it from the desktop
and it will unpack itself. If it exits immediately after starting, check if your
disk is write-protected or if you have enough free memory.
STZip can handle the 'deflate' method. It's the best Atari ZIP you can get!

uw is definitely not x windows. uw just multiplexes terminals over a serial
line. in other words, you'll have multiple gem windows on your ST showing
output from multiple unix shells running on the remote machine. this
works very well, especially at higher speeds (9600+), but you can't run
things like xclock or xload, xv, etc... for that, you would really need to
be connected through an ethernet network. i suppose it could be done
with slip and xserver software (I heard it exists...), but it would be slow!

>Matija.Grabnar@ijs.si A Slovenian and an Atarian
>Josef Stefan Inst. Ljubljana Stefan's law: the highest power in the Universe
> I speak for no one but myself.
>

There is an accesory that comes with gemview which will let you save any
size of IMG file in up to 8bit resolution. I think it is called SNAPSHOT.

Yes, you're perfectly right. I tried it with a 14400 baud connection using
not slip but term. It's really slow and only makes sense with X programs that
don't change the appearance of their windows too often.

>
That is simply bullsh*t; there are integrated unser interfaces around that feel
much like ftp (have you tried to connect via telnet to an ftp port? Then you have
NO user interface). The speed depends very much on the priority the server process
has on the remote machine; in fact, under some circumstances, fsp can even be faster
than ftp. If your sites are all gone, that might be due to the fact that you
might be using the wrong servers.

4802. Strange Falcon Problem... Help again, please!

Newsgroup: comp.sys.atari.st
Date: 1993-09-29 19:22:53 UTC
From: kendall@flammulated.owlnet.rice.edu
Message-ID: <KENDALL.93Sep29132253@flammulated.owlnet.rice.edu>
Source record: 200377
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Well, this time I have a really wierd problem with my Falcon... It
now locks up when doing certain things.

To be more precise, the machine locks up and I hear "static" through
my speakers when:

I try to save SCSI info in diamond edge
I try to start SETUP going (from the MINT install kit)
or when I access any of the three lowest "help" menu items from SETUP.

So, any ideas? All other things seem to work OK, so far - these are
the only times the problem occurs.

Thanks,

--

4803. Need info on Quantum LPS105S

Newsgroup: comp.sys.atari.st
Date: 1993-09-29 19:56:45 UTC
From: randyh@sad.hp.com
Message-ID: <CE4sqM.8Kv@srgenprp.sr.hp.com>
Source record: 200366

I can get a pretty good deal on a Quantum LPS105S and I was wondering if anyone out there has had any experience with them? I have an older ICD Host adapter, will it work with this drive? Do I need to disable parity or anything? Also, is it quiet? It probably is but the 20 meg Supra I have now is very loud. Don't want another one like that.

Thanks, Randy

You don't need an ethernet connect or slip, you definetly do need an Xserver
(what else is gonna show the stuff on your screen). And you need also someway
of redirecting the remote X-socket to a local X-socket. This can be done by
the program 'term' which is distributed with Linux packages.

So, if there is an Xserver working under MiNT (I would like that), then the
packages could in no time be ported. You have then effectively created your
own X-terminal. Ofcourse running X-programs locally is out of the question
(well feasiable for the Falcon/TT), they are too huge!

Greetings,
Gerco.

PS: Yes, term is slow!

Nope. But you will end up using up your three of your six permanent processes (Desk accessories) for word processing, telecommunications, and command shell. All this in 512k of memory. :)

I've once had this drive with my former MEGA-4, in an external case.
The performance of the LPS105S is EXCELLENT. It is quiet, very fast
and very reliable. I never had any problem with the drive.

The drive was connected to the computer with an ICD host adapter.
IMO, it shouldn't be important how old your adapter is.

Unfortunately, I can't tell you anything about the parity.

Chris.

No no no :) Matrix Cards are Matrx Card from Matrix...NOVA is sold in the USA
by Lexicor but are in fact from Computerinsel..they are two different products.

No, the problem would be that the ST has no mmu (no real mmu), which
can map logical to physical addresses and protect memory from unwanted
access.

There is a bug in the dLibs strtoul() (I think... it was one of the
str*() functions) that Ian seems to have forgotten to fix... It showed
up really early in the 1.40 beta test, and was fixed real soon... Ian
should learn to use RCS or something to track bugfixes! ;-)

The fix involves rebuilding the dLibs library, and then rebuilding all
of the utilities. Not something you can do easily. :-\

Yes, please, both! I'll kiss your feet! :)

I was trying to compile elm, but I couldn't get the Configure script to
run properly. :-(So far, I've been too lazy to do it by hand...

Now on to get Taylor going, and I'll be able to ditch this slow TOS fs
and use minixfs for my news and email (I guess Hermes will have to go
too then...).

> Any clever ideas?

Not a solution, but... Does this mean ISHAR 2 will work in monochrome,
or do you have a severely mutated STacey?

So far, Wonderland is the only resolution-independant game I've found...
and it's much nicer to play in monochrome (thanks to the extra screen
area).

I am back.. More good news. New Quadras out on October 4. The first 040 Mac Quadra with monitor and keyboard for $1500 list.

Quadra 605 4/80 with monitor $1500
Quadra 610 8/160 with 25 mhz 040 and ethernet for $1549 list
Quadra 650 8/230 with 33 mhz 040 and ethernet for $2299 list

As usual the Falcon has lost the price/performance. Lets see Atari can beat its last quartely sales of six million with a three million quarter. Can Atari go lower than that and survive with massive layoffs? Stay tuned for further details.

I'll agree that it's faster than ATM (since I've used both on the same
hardware), but the memory requirements are worse, and Speedo's _really_
slow if you have more than about 10 fonts active.

I'd be willing to wait a little longer for fonts to render if they were
type-1; there are thousands available for free or for low ShareWare
fees. I have an Atari, I'm used to waiting... ;-)

What I find very amusing is the number of "Atari supporters" who apparently have nothing to say in answer to the original question that started this thread.

John Hutchinson: So you'd rather belittle the answer I gave than give one of your own..? Who's being predictable now..?

Richard Venable: You think your post was amusin? Why not save the net bandwith with your "Atari cheerleader" comments, and give a useful answer to the original question?

You wasted over 1K of space, including a large .sig, to say essentiallly nothing.

I have to wonder why it is none of you have tried to answer the question about the state of the Atari market now, as compared to six years ago...

Maybe you're afraid to take a non-rose colored look at it..?

(Or shall we just lie to the guy, so he'll have to suffer along too..?)

Message-ID: <91964@cup.portal.com>
Source record: 200255

Sorry, I don't frequent High Street Atari shops, or read UK magazines.

My experience is that Atari promised great things for the Falcon,
and they did not deliver.

Atari dealers are even harder to find, there is NO advertising, and
even the hard-core developers are pissed off at the non-support.

I can't report on what's happening elsewhere, only my own direct experience.
If you call that "whining", then that's really too bad. The truth may not
be pleasant, but it's a truthful answer to the original question that
was asked here.

Why not answer the original message with your own experiences instead of
turning it into personal attacks and a flame war..?

No, the problem would be that the ST has no mmu (no real mmu), which
can map logical to physical addresses and protect memory from unwanted
access.

Not a problem for TT's and Falcon's, which can do both these things.
And have a larger screen area..

I haven't got the exact figures right now, but I can say this much: The 256 colour mode now feels about as fast as the 16 color mode without it.

I might post a full benchmark for you later...

He does not have an email address anymore. He does subscribe to the German Mausnetz and his address there is Christoph_Strunk@kr.maus.de, but he hardly ever logs on there any more. You'd be better off writing him a letter. If you want a reply, include an IRC.

Sorry, but that's life.

Sure! I'll certainly give you all the info you want :), anyone else who
want's to have more info about the NOVA or SuperNOVA just simply email:

Lexicor@world.std.com

and you'll get all the NOVA info (and Lexicor Software stuff) you want :)

Dirk...and yes, the NOVA will run on your 1040 STE...however it will have
to be the Megabus version, but there are upgrade path's too..

P>have to be a certain speed or am I thinking of something else?
Not all 68882 coprocessors are the same. There are variants regarding the clock-frequency. But all these 68882 should work perfectly in your Falcon as far as I know. But you SHOULD (you do not have to) use a 68882 with 32 MHz, which allows you upgrade your Falcon-motherboard with higher-clockfrequencies.

Ciao,
Carsten

> in particular about the Acorn Electron.

There are several Apple][emulators available on anonymous ftp.
They all contain a 6502 emulation. Some are 80x86 assembler (for IBM-PC),
others are written in C (mostly for Unix, Amiga etc).
Here is a list of emulators (from the FAQ of alt.emulators.ibmpc.apple2):

for IBM-PC:
apl2em -Randy Spurlock's][+ emulator (version 1)
apl2em-2 -Randy Spurlock's][+ emulator (version 2)
applemu -48K][+ Emulator (author unknown)
for Unix:
ap2e and ap2egl -Randy Frank's Apple //e emulator
II+simulator -Ben Koning's Apple][Emulator
apple2 -Peter Koch's Apple][+ emulator
Apple2Emul -Rich Skrenta's Apple II emulator
(with Amiga CLI from Tom Markson)
for Amiga:
Apple2Emul -see above
AppleOnAmiga -Claudio Nieder's Apple 2 Emulator
(written in Modula-2 (M2Amiga V4.1))

Look at the following ftp-servers:
wilbur.stanford.edu:/pub/apple2
ftp.uni-kl.de:/pub/apple2/emulators

In his response to Andy's posting, Theo Hopman (thopman@herman.cs.uoguelph.ca)
wrote:

>easier just to buy an old Electron (unless they're rare/expensive)?

Because it's much fun writing such an emulator!!
I've written an Apple][+ emulator (for Unix and X Windows) ;-)
You can learn a lot about programming in general and the hardware of the
emulated computer.

>Emulating it on a regular ST will be _slower_ than the real thing.

Of course! Even in highly optimized 68000 assembler you couldn't expect
it running as fast as an orig. Acorn Electron.

From my experience (on a Sun 3/260 with an 68020 25MHz), my 6502 emulation
(written in C) runs 6 times slower than a 6502 at 1MHz :-(
I've heard, that apl2em-2 (Apple][+ emulator in 80x86 assembler) runs at
fair speed on a 386SX at 33Mhz.

|> Does it require 1MEG or more. Does it require > TOS 1.0, or a H.D.??
Calamus is pretty much the premier DTP package for the ST/TT/Falcon. There are 3 versions - the original, Calamus S and Calamus SL. The latter being full colour, thr former 2 mono but with increasing power. I wouldn't try and run it off floppies unless you really had to. As with any DTP package, you need a lot of hardware. I'd say 1Mb would be tight. better with 4 especially if you use a lot if images and fonts.

It uses it's own font scaling technology which *some* people consider to provide superior output to postscript.

I wouldn't use *any* Atari with a TOS <1.4 it's just not worth the hassle considering how cheap it is to upgrade and the resulting benefit - especially HD handling.

>...
Why do you need an expansion box for 64/96 tracks? I think you're confusing
tracks with MIDI channels. I run a sequencer with numerous tracks, but
do not need any expansion provided I keep to 16 channels.

Two examples:
1) I put the basic drum parts on one track, and the percussion overdubs
on a separate track. This aids arrangement. But they are on the same
MIDI channel as both come from the same device.

2) When running short of sound generators, I might have my D50 producing,
say, a piano on the intro and strings on the chorus; I would keep these
separate parts on separate tracks, but they share a MIDI channel.

(load sof text doing just what Bob complained about - deleted)
Bob,
All I can say is that I bought a Falcon after having to call a lot of
places due to the fact all stock was selling out as soon as it arrived in the UK.
Note a *lot*. We have many places to buy from. Prior to this, Atari aanounced the
public availability of Falcon programming docs. They didn't use to do this. I
have found it easy to buy Falcon specific software - there is quite a bit about.
I have loads of Falcon PD - including direct to HD sampling packages, GIF,TIFF
showers, great games (Nethack - worth buying a Falcon for!) and much more. Atari
also had an advertising run upto the release of the Falcon in the UK and are
still advertising it now. All the music/MIDI mags rave about the Falcon.

All my software bar VIP Pro works fine on the Falcon - and I have had an
ST since '87 so I have a lot of it. I have also got upgrades to various packages
where Falcon compatability was a problem.

I'm basically very happy with the Falcon and the software and support
available for it. When the RAM prices come down I will be upgrading to 4Mb and
will probably buy one of the various video digitisers that are/will be available.
A package has just been released - Falcon videomaster that allows 64
greyscale/256 colour digitising to be combined with sampled audio complete with
editing of sound & vision as required. Looks good at 99GBP.

|> and they did not deliver.
You've gone all reasonable. Damn. :-) At least you now admit that your probems have been your own experiences and as such are not based on a worldwide situation which *is* different. Atari aren't the big, successful company they were, but they are also not as bad as you like to think.

|> Atari dealers are even harder to find, there is NO advertising, and
|> even the hard-core developers are pissed off at the non-support.
Have you thought of buying mail order from the UKor elsewhere in Europe? It may not be as expensive as you think.

|> Why not answer the original message with your own experiences instead of
|> turning it into personal attacks and a flame war..?
I've done that in a previous msg, just posted.

The latest version that i bought of calamus S, with falcon update. supports
Gif, Iff and whole lot more pictures, printerdrivers aren't any problem
cause about 25 are delivered with the program. So Epson,star lc10, hp deskjet
and hp laser are all supported. (I use a falcon with calamus, so the gifs
may not work on a st - you'll have to ask a st calamus user)

The update version requires 2 meg at least, or else the disk swapping is
tremendously annoying. version 1.09 works very well. But doesn't support
(i believe) any gif pictures.

A hard disk is also recommended although i used 1.09 version for about 2
years without a harddisk on a st. That one is still useable without one.
Calamus S/SL is definitly needing a harddisk.

>any info would be appreciated!

I hope this is enough info.

There are 3 different versions of Calamus available. Judging from
your question, I think the smallest one would be the ritht for you ;-)

It's Calamus 1.09 that supports any type of printeryou can imagine.
It can import many different bitmap and vector graphic files, but not gif -
and only in monochrome (use GemView to convert them).

You don't need a HD for that, and even 1MEG could be enough for small
jobs. But for heaven's sake - don't use TOS 1.0 in any case!!!!

4859. HSC mailing list problem solved.

Newsgroup: comp.sys.atari.st
Date: 1993-09-30 11:00:29 UTC
From: error@blade.stack.urc.tue.nl
Message-ID: <28ee8d$q1r@tuegate.tue.nl>
Source record: 200272

Okay okay, so I screwed up. But the problem has been solved (and another introduced).
From now on the hsc (heat 'n serve c mailinglist) is located at hsc@stack.urc.tue.nl .The old address did not work.

Subscribing to the list is easy just send mail with subject subscribe to hsc-request@stack.urc.tue.nl

A last word of caution, do not just reply to messages you get from the mailing list. The reply address is still wrong. I am working on the fix, but as always I will have to wait for the system administration to do the work...

The Heat 'n Serve C mailing list is for everyone by the way, from absolute C beginner to experienced C professional (though I doubt that experienced C professionals will rely solely on HSC ;-).

Erlend.

Well, I doubt if you can buy the 68882 at anything slower than 16MHz, so
THAT should be ok for a falcon, but perhaps you should keep an eye on
the pinout or if it's a DIL or PLCC chip or whatsoever (don't know).

Schiller

PS: Is there a DIL version of the 68882? Doubt so...

I can't tell if the adapter will need parity to be switched off, but as
far as I know all Quantum LPS drives _do_ have a jumper to do so - at least
the LPS240S has got one - contrary to the ELS series, which _don't_ have
one. There was a discussion about this some months ago and if I didn't sleept
over most of the stuff, that was the conclusion.

bjgrier@bnr.ca (Brian Grier Perpk) writes:

>Nope. But you will end up using up your three of your six permanent processes
>(Desk accessories) for word processing, telecommunications, and command shell.
>All this in 512k of memory. :)

Not necessarily. First of all, I don't recall the minimum memory
being a requirement of the comparison. My Mega4 w/AdSpeed was
wonderfully useful with the Gemini desktop, Harlekin, STalker, and
Chameleon running. I had access to a cli through Gemini, could create
scripts I could drag and drop things into to use unix style filter
programs, have STalker downloading in the background, pop up any of the
14 or so modules in Harlekin, and load desk accessories on the fly with
Chameleon.
This was a wonderful working environment I have yet to manage to
duplicate under DOS or Linux, though OS/2 comes close, but
unfortunately, if you don't have 16 meg, OS/2 is swapping as it loads
it's desktop shell. Also, the Workplace Shell is one of the worst GUI's
I've ever seen. Even Windows makes more sense than the design philosopy
in WPS.
You could probably put together a nice X environment, but certainly
not for free.

You've seen it before from others, and now I need one....

Any good suggestions for font editors? My immediate need is to
rescale screen fonts for Epson 9-pin (eventually I hope 24 pin:-)
which will force editing of the result I'm sure:-). I'd consider
commercial or PD - I wanted to check the latest price for FontKit, but
I can no longer find it advertised in the UK magazines (yeah, I'm in
the US, but I don't mind ordering overseas).

Any help appreciated. Thanks and have fun! - Bob

>DAs and TSRs to no effect. Am I doing something wrong? This seems like a
>pretty big bug not to be mentioned.

The bug actually has nothing to do with Geneva, it is purely a problem with NeoDesk 3.04, and only in ST medium resolution. More specifically, it is caused by an error in the medium resolution resource file. Dan has a fix for it, (new resource files for NeoDesk 3.04) which I believe he intends to post to GEnie and Compuserve next week, when he will also be posting a Geneva patch program for people who bought it at the Glendale show. Owners of the .95 beta versions will be recieving the same fixed resource files with their full 1.01 versions.

The problem is actually only cosmetic and temporary. If you make NeoDesk redraw the portions of the screen that have been drawn incorrectly, it will be fixed.

Just FYI for all GEnie users...

Missionware Software has a new product support category on GEnie. It's
CATegory 25 and should be active on October 1st. There will be separate
product support topic areas for the following software titles:

Flash II
Printer Initializer
LottOdds
Mecha-Naught
Cyberdrome *
Crossword Creator II *
Word Search Creator *
The Cryptographer *
InfoDisk *

* These are new additions to Missionware's product line just picked up
from Fair Dinkum Technologies.

To check out the new category, type M475;1 from any GEnie prompt. Then
select Category 25 from the RT prompt. See you online!

4877. Re: Windows 3.1 driver for Atari Laser Printer

Newsgroup: comp.sys.atari.st
Date: 1993-09-30 16:11:16 UTC
From: Iain.Laskey@barclays.co.uk
Message-ID: <CE6Cyt.Jr2@barclays.co.uk>
Source record: 200163

In article <CE2MA5.Gs1@bernina.ethz.ch>, osuna@isi.ee.ethz.ch (Jose Osuna) writes:
|> Where can I get a Windows 3.1 driver for an Atari Laser printer
|> (?? 605) from? Is it possible at all to connect the Atari printer
|> directly to the PC?
Forget it. The Atari printer worked in a completely different way to any other laser. Laser printers have a processor & RAM on board that builds up the image of the page. The SLM printers use the Atari to do this and then fire the image straight down the DMA cable. As a result, your problem is 2 fold, 1, you can't the thing attached to a PC as PCs don't know about Atari DMA and 2 even if you got a physical connection, the printer wouldn't have aclue what to do with any bytes it saw coming down the cable.

|> It would be sufficient to copy the printable file
|> on floppy, pass it to the Atari computer and print the file from
|> there with the Atari printer.
A page at 300dpi would be huge - well over a mb and so even if you could cobble together a Windows driver that would print to a file as a binary image or whatever, you couldn't fit it on a floppy.

|> I do not think that it is necessary to buy a new laser printer if one
|> wants to "upgrade" from Atari to PC. ;-)
You will I'm afraid. Lasers are pretty cheap these days. a cheap HP is about 500GBP and will probably print nicer than the SLM anyway. You could probably get 300GBP for the SLM so you only have a bit of cash left to find.

Excuse me folks, but

[FLAME ON] (yes, I am the "human torch") :)

In article <91957@cup.portal.com>, Bob_BobR_Retelle@cup.portal.com writes:
|> What I find very amusing is the number of "Atari supporters" who
|> apparently have nothing to say in answer to the original question
|> that started this thread.

I thought it had already been answered, from a number of points of view;
I also think such discussions belong in comp.sys.atari.advocacy, and
wonder why you apparently don't.

|> Richard Venable: You think your post was amusin? Why not save the
|> net bandwith with your "Atari cheerleader" comments, and give a
|> useful answer to the original question?

I'm not an "Atari cheerleader", I'm simply an ST owner who's grown tired
of your sniping, Sinclair's "Mac cheerleading", and other irrelevant topics
in this newsgroup; if that makes me a "network cop" then so be it.
I'm really only asking that posters to comp.sys.atari.st keep in mind
the guidelines of 'netiquette', and post in the proper newsgroup. Is
that too much to ask?

|> You wasted over 1K of space, including a large .sig, to say essentiallly
|> nothing.

You know, 1K is only 20 lines of 50 characters; and a 4-line .sig is NOT
large, compared to what I've seen; and as some have suggested, there is
a 'kill' feature in many newsreaders. And your "answer" is as misleading
as those with the "everything is wonderful" point of view; it isn't, but
the situation is not as bleak as you keep portraying it. And the post
I'm responding to (by you) contributed nothing, and was 22 lines long.

|> I have to wonder why it is none of you have tried to answer the question
|> about the state of the Atari market now, as compared to six years ago...

It has changed; this might make an interesting topic for ADVOCACY.

|> Maybe you're afraid to take a non-rose colored look at it..?

No, I just don't know why you are so negative, and keep making
unsubstantiated claims about what Atari intends to do; are you on
the board? Or do you have some grudge against Atari? How about some
REAL facts instead of all this negative speculation? And try posting
to right newsgroup for a change...

|> (Or shall we just lie to the guy, so he'll have to suffer along too..?)

Suffer? Do you still have an Atari machine, after all your whining?
I agree some contributers here are perhaps overly enthusiastic about
the Falcon; I have also suggested to a few of those that perhaps Falcon
vs. Brand X discussions belong in the comp.sys.atari.advocacy newsgroup.
I guess I'm guilty of 'consistency' as well, eh?

[FLAME OFF]

Here, just for BobR, is a special shortened .sig ;~]

>code.

Well, that's probably true. Bugs are all relative, of course. Most of those bug fixes allowed Quick ST to work better or faster, but were not necessarily 'show stoppers.' The original post gave me the impression that Quick ST was bug ridden and I never found that to be the case. That's not to say it was on the same level of excellence as Warp 9 or NVDI, of course.

Heavens, I wouldn't dream of using an ST without a screen accelerator! I find it amazing how many people suffer through without one, though. Same goes for UIS III as opposed to the standard file selector... yuch! :)

4881. Advice wanted re STe memory

Newsgroup: comp.sys.atari.st
Date: 1993-09-30 17:03:57 UTC
From: john@hpwin052.uksr.hp.com
Message-ID: <CE6FEM.1HH@hpwin052.uksr.hp.com>
Source record: 200290

Hello,

I apologise if this question is a FAQ and documented as such but I don't have the FAQ list for this group. Anyway, here goes...

I want to upgrade my 1024 STe to at least 4MB memory. Quite simply I need to know what type of SIMMS need to be used. I have been told by one supplier that I cannot use the 1MB it already has in any upgrade. That seemed rather strange to me. Is what he said correct ? Also, what total memory configurations are possible and is 4MB the most it can take. Lastly, do the SIMMS have to be put in in identical pairs, eg. 2 of 1MB or can I put in just one 1MB ?

Any help with these questions is much appreciated.

John Radley

I have bought an ATARI 1040 ST two years ago and I was in Germany at the time. My family who still live there try to use what they have , but it is not much. My sister especially does all her school work using the Word Plus 3.1 the only disk that was available in Germany. Other than that, there are no language disks, games, in short no kind of hardware or software is available for the 1040 ST in Germany. I have not come across to an ATARI dealer here in Seattle, and I would like to hear from those who could give me the address of the closest ATARI dealer so that I can get and send some stuff to my sister. Because with what she has, she simply can't get anything out of that great machine.

4883. Re: CyReL SUNRISE M16-1280 True Color Graphics Cards

Newsgroup: comp.sys.atari.st
Date: 1993-09-30 17:27:00 UTC
From: cybercube.research@canrem.com
Message-ID: <60.37678.4514.0N184EEA@canrem.com>
Source record: 200292

I would like to correct a couple of incorrect post that have appeared in this conference regarding the True Color modes of the CyReL SUNRISE M16-1280 True Color High Resolution Graphics Cards.

First, the CyReL M16-1280 is the only graphics card to offer such True Color resolutions like:

640x480 x 32
720x576 x 32 (important for video applications)
768x576 x 32 (ditto)
800x600 x 32
960x544 x 32
1024x512 x 32 all in either Non-Interlaced or Interlaced!

In addition, the card support very high refresh rates (up to 260 Hz), but we recommend that the users stick to the more common refresh rates like 66, 72, 76, 84 or 92 Hz.

With the recent addition of our CyReL VidiMix16 Dekstop Video Modules, you can expand the CyReL M16-1280 to a complete desktop video workstation, capable of capturing live video in realtime & True Color, resize live video in realtime, GEN-Lock to either PAL, NTSC or SECAM and even encode your computer graphics into broadcast quality TV signals. The CyReL VidiMix16 offers all this for just US $395.00.

Our custom designed True Color drivers offer superior performance and have been designed to maximise compatibility. Every card comes with more than 1.4 MB of software, as well as a FREE one-year software upgrade plan and a sincere commitment to customer support.

If you would like to receive more informations, please send e-mail to: cybercube.research@camrem.com or cybercube@genie.geis.com

> any info would be appreciated!
>
> Thanks in advance.
>
> Chris.

Chris,
There are 3 types of Calamus Programs : Calamus, Calamus S, Calamus SL

I own Calamus SL and I'm very pleased with it. It supports SLM804, Epson LQ,
HP laser Jet II,III,4 (last I heard they were working on this HP laser 4)
- it can also output to Linotronic Imagesetters.

It can import GIF,TIFF,GEMIMG,IFF etc...

I believe it can run with just 1meg, but it can be painfull, in that there
would be module swapping (ie. need to take out of memory 1 module to use another)
which means also swapping in/out modules

A hard drive is recommended but not absolutely needed, but you'll be doing alot
of disk swapping.

The preference is to use a machine with 4meg memory and have the entire program
installed on your hard drive.

=====

Now Calamus (the first one, not SL or S) gives more freedom mainly because it
wasn't written in modular form, in that you won't have to do as much disk swapping
and Calamus S is a between package between Calamus and Calamus SL.

=====

I use a TT030, 10meg, 130meg HD, .28 dot pitch Monitor, running Neodesk 3.03

Calamus SL can do full color seperations, vector graphics manipulations both
of generating and editing, import BW raster, Greyscale also.

It also has an editor for text, there is a driver also to use MicroTek family
of scanners, so that means 256 color/greyscale flatbed scanner.

Also there are modules for brush painting, postscript generating, Kodak photo CD module, They also sell the Cyrel Sunrise Graphics Card for increased productivity.

There are many more features of this program (Calamus SL) these were just off the top of my head.

The version you'd want was done in July '93 - this incorporated many new additions and fixes.

Hope this helps,
Scott

You should be able to order FontKit from The ST Club...look in their magazine ST Applications. There are various PD/SW editors on atari.archive in the Applications/Dtp/Fonts directory, but they aren't very good. EDIF_GDF has a small working area, so you can work with large fonts, and GEMFO120 is in German, and I couldn't get it to load anything.

I think its only Ishar 1 that is Falcon Specific so far...256 cols, better sound etc. You do have to order the Falcon version. There was an ad for it in ST Format about a month back. Transarctica is also out as a Falcon specific version too.

Has anyone seen Llamazap? It looks pretty smart...Jeff seems to have produced another astounding game which might really show off the Falcon (for a change!).

Bob,

You are obviously misinformed. I write for Atari ST Review and at the moment there is more new stuff out each month than we can fit in the magazine. I receive new programs for review almost every day. There is a pile of programs under my desk just waiting to be reviewed. We just don't have the space to cover everything.

No matter what tint my glasses are, the pile of programs is still there, maybe it's something I drank...

I honestly had to clean my glasses and read this again a few
times before I could actually believe I was not dreaming. There
are just *tons* of software available here in Germany for Atari
computers. And actually, 1st WorstPlus is among the crappiest
pieces of software around. I suggest your sister should switch to
Signum or That's Write.

>Other than that, there are
>no language disks, games, in short no kind of hardware or software is
>available for the 1040 ST in Germany.

Well, other than the language disk that comes with the 1040 ST
and ist a piece of crap, there is GFA basic (interpreters are
freely available, compilers are commercial), Pure Pascal, Pure C
for languages, loads of games including Amberstar, Bloodwych,
Dungeon Master, as well as innumerable PD stuff available from
many ftp sites. And then, many other application programs are
available for graphics, sound, statistics, DTP, business..... As
for hardware, harddisks are easily available, other things as
eprommers too, it depends what you're looking for.
Atila, I'll mail you a list of software authors that is regularly
posted in de.comp.sys.st, I just saw the current version posted
today. I could also look for the Atari software directory that I
know is floating around somewhere here.

JH>duplicate under DOS or Linux, though OS/2 comes close, but
JH>John Henders GO/MU/E d* -p+ c+++ l++ t- m--- s/++ g+ w+++ -x+
John, I have to agree. I now have two STEs (one with an Adspeed) and two MS-DOS machines (one 386 laptop and one 386/33 with hi-res card and sound blaster pro, etc) and I still prefer using Gemini, and now to some extent Geneva, on my STE than Windows on the clone.

In fact the only things I really like on the clones is 1)hi-res color for GIFs, game graphics are about the same, but GIFs look great (sorry Photochrome) 2)Lotus Improv, the most incredible spreadsheet in the world and 3)Spaceward Ho, a great game. Now that I find out that I can get a hi-res color board for my STE that list will be down to just two and that's weighed against all the cool games I have on my STE (Chaos Engine being my most recent fave).

One thing I don't like about my STE is the lack of expandabilty. I heard about a UK board that would up the RAM to 12 Meg (4+8). Does anyone have any info on this? Can I install it if I already have an Adspeed installed, is there any room left inside the case??

But why will the 6502 emulator run slower? I remember playing around with the speccie emulator and the c64 emulator on a.a.u.e as well, and the ran just as fast as the real thing - they actually had huge loops/delyas in them so that the ST wouldn't fly away ....

Karl.
